Attachment A – Executive Summary

**Walk Bridge Replacement Project
Bridge No. 04288R, Norwalk Connecticut
State Project No. 0301-0176**

Attachment A – Executive Summary

1. Project Description

In cooperation with the Federal Transit Administration (FTA), the Connecticut Department of Transportation (CTDOT) proposes to replace the New Haven Line Railroad Bridge (Walk Bridge, Bridge No. 04288R) crossing the Norwalk River in Norwalk, Connecticut. The existing Walk Bridge over the Norwalk River, constructed in 1896, is a four-track movable railroad bridge consisting of a 200-foot swing span, supported by a center pivot pier, and two fixed approach spans to the west of the swing span and one fixed approach span to the east of the swing span. The structure carries four tracks of Metro-North Railroad (MNR) commuter rail, Amtrak, and two freight carriers.

The project consists of the removal of the existing bridge, including the superstructure, substructure elements (abutments and piers), timber pier protection system, and deactivated electrical and railroad submarine cables; and construction of the replacement bridge. The four-span replacement bridge includes two side-by-side, 240-foot vertical lift spans across the Norwalk River, each with independently operated mechanical and electrical equipment. The pair of 240-foot vertical lift spans provides a horizontal clearance of approximately 220 feet between pier-mounted fenders; however, the project does not alter the 170-foot federal navigation channel. The lift spans provide 60.73 feet vertical clearance above mean high water (MHW) when the span is fully raised, and 25.73 feet vertical clearance above MHW when the span is closed. There are two western approach spans and one eastern approach span. The approach spans are side-by-side, two-track structures; the north structure carries Tracks 1 and 3 and the south structure carries Tracks 2 and 4. Each structure is comprised of a precast concrete composite ballasted deck supported on four simply supported built-up welded plate girders. The lift spans are 40-foot deep through trusses, each with a double-intersection Warren truss configuration without verticals. Each lift span is an open-deck two-track structure made up of trusses with floor beams supporting track stringers. Tower structures at the end of the lift spans support the lifting mechanisms and counterweights for both lift spans. Short deck-girder spans through the towers at each end provide continuity from the approach spans to the movable spans.

In addition to replacement of Walk Bridge, the project will include other improvements within the railroad right-of-way, including replacement of track and ballast and overhead catenary and supports from approximately the Washington Street Bridge to approximately 300 feet east of the Fort Point Street Bridge; realignment and replacement of the Fort Point Street Bridge; replacement of retaining walls on both sides of the railroad corridor to the west of Walk Bridge; construction of new support walls at the west abutment; and construction of a new retaining wall to the southeast of Walk Bridge. Additionally, the project will include construction of a pedestrian/bicycle trail connection to the Norwalk River Valley Trail's Harbor Loop Trail in East Norwalk.

2. Project Purpose

Walk Bridge is a critical piece of public infrastructure on the New Haven Line/Northeast Corridor (NHL/NEC). Walk Bridge carries Amtrak intercity and high-speed passenger service on the NEC, is used for Metro-North Railroad (MNR) commuter rail service and Providence and Worcester Railroad Company (P&W) through-freight service. Replacement of the existing Walk Bridge will support Amtrak, MNR and freight service. Additionally, Walk Bridge is the northern boundary of the Norwalk Harbor, rated as a small commercial port by the U.S. Army Corps of Engineers (USACE), with over 2,300 moorings and berthing spaces, and between 2,000 to 3,000 commercial vessel trips per year to port facilities. The replacement bridge will support marine use and operations on the Norwalk River.

The purpose of the project is to replace the existing deteriorated bridge with a resilient bridge structure which will enhance the safety and reliability of rail service, offer operational flexibility and ease of maintenance, and provide for increased capacity and efficiencies of rail transportation along the New Haven Line/Northeast Corridor, while maintaining or improving navigational capacity and dependability for marine traffic in the Norwalk River. Upgrades to the Walk Bridge, through replacement, are needed to increase bridge reliability, incorporate bridge redundancy, and provide a sustainable bridge for significant weather events, thereby accommodating current and future rail and marine traffic.

3. Summary of Environmental and Engineering Analysis

CTDOT prepared an Environmental Assessment/Section 4(f) Evaluation and Environmental Impact Evaluation (EA/EIE) in compliance with the National Environmental Policy Act and Connecticut Environmental Policy Act (NEPA/CEPA). The EA/EIE included an Alternatives Analysis, wherein CTDOT identified a range of alternatives; narrowed the alternatives based upon the ability to meet the purpose and need, costs, and/or environmental impacts; conducted a thorough evaluation of three options; and selected a preferred alternative. The Alternatives Analysis is included in this application in response to **Part III, Question 9**. The Connecticut Office of Policy and Management issued a determination that the EIE satisfied the requirements of CEPA and issued a Record of Decision (ROD) on July 6, 2017. The Federal Transit Administration (FTA) determined that CTDOT complied with the requirements of NEPA and issued a Finding of No Significant Impact (FONSI) for the project on July 17, 2017.

The design of the Walk Bridge Replacement Project has advanced since the 15 percent conceptual level that was analyzed in the EA/EIE. The design advancement since the conceptual design resulted in limited design modifications, while also refining the construction methodology of the Construction Manager/General Contractor (CM/GC). Additionally, since the issuance of the FONSI/ROD, CTDOT has conducted multiple meetings with federal regulatory, state, and local regulatory agencies to refine project mitigation and advance permitting. In response to these refinements in engineering design and construction methods, CTDOT submitted Environmental Re-evaluation Consultation Forms to FTA in July 2019 and in February 2021 to address potential impacts. Based on FTA's review of the July 2019 Re-evaluation Consultation, FTA concurred that the proposed changes would not result in significant adverse environmental impacts and verified the FONSI on September 19, 2019. FTA's decision regarding the February 2021 Re-evaluation Consultation is pending.

The project will result in 8,700 square feet (0.20 acre) of permanent impacts to tidal wetlands and intertidal flats. Wetland mitigation will involve treatment and removal of invasive common reed (*Phragmites*

australis) in and adjacent to existing tidal wetland areas, restoration of degraded tidal wetlands to functioning salt marshes, and restoration of low-function riprap flats to higher function tidal salt marshes. Selection and development of the wetland mitigation sites was done by CTDOT Office of Environmental Planning (OEP) in close conjunction with the Connecticut Department of Energy and Environmental Protection (CTDEEP), as well as local stakeholder representatives from the City and the Maritime Aquarium, who were also given opportunities to review the mitigation plans. Project mitigation is described in Section 7 of this Executive Summary, “Summary of Environmental Protection Measures and Compensatory Mitigation” and **Part III, Questions 2a and 4**.

CTDOT OEP has conducted extensive reviews with federal and state agencies regarding protection of federally and state protected species. CTDOT OEP consulted with the National Oceanic and Atmospheric Administration/National Marine Fisheries Service/Greater Atlantic Regional Office (NOAA/NMFS/GARFO) Protected Resources Division (PRD) for Endangered Species Act (ESA) Section 7 species and NMFS Habitat and Ecosystem Services Division (HESD) for Essential Fish Habitat (EFH) regarding the project action area, which includes construction barge traffic from vessel mooring locations in outer Norwalk Harbor (proximate to and south of Manresa Island) north on the Norwalk River to approximately 1.3 miles north of the bridge site. Consultations were conducted in December 2014, and subsequently in June–August 2018, June–August 2019, and June – December 2020 with NOAA/NMFS/GARFO. The agency provided recommendations and issued concurrences that with the incorporation of protection measures, the project is not likely to adversely affect any NMFS ESA-listed species or designated critical habitat. Additional Section 7 ESA coordination was completed for species under the United States Fish & Wildlife Service’s (USFWS) jurisdiction via on-line screening using the USFWS Information for Planning and Conservation (IPaC) tool (initially in September 2015 and subsequently in October 2018 and August 2019 for the Walk Bridge site and in February 2020 for the Manresa Island site). On behalf of FTA, CTDOT coordinated with the USFWS under the final 4 (d) streamlined consultation process. CTDOT also consulted with CTDEEP Wildlife and CTDEEP Natural Diversity Database (NDDDB) for interpretation of the best scientific data available for listed species. For state regulated species, the CTDEEP NDDDB and CTDEEP Wildlife were consulted initially in November 2014, and subsequently in February 2016, May 2019, March 2020 (for the addition of Manresa Island Staging and Storage Yard), and March 2021. Time of year restrictions and other best management practices (BMPs) will be incorporated into the project through permit conditions and contract specifications. **Part III, Question 4 and Attachment M** contain further descriptions and documentation of federal and state coordination and approvals.

4. Summary of Project Construction

4.1 Overview of Construction Activities, Sites, and Regulated Areas

To facilitate CTDEEP’s review of the application for a Structures, Dredge and Fill, and Tidal Wetlands permit and 401 Water Quality Certification, CTDOT has organized project construction into 19 construction activities at ten sites at and near the existing Walk Bridge (as shown in Figure ES-1 and ES-2). Construction activities for this project are extensive and will span the course of approximately five years. A detailed listing of construction activities along with means and methods is located in **Part III, Question 2a**.

Figure ES-1 – Walk Bridge Replacement Project, Sites 1 through 7

Figure ES-2 – Walk Bridge Replacement Project, Sites 8 through 10

Sites 1 through 3 are located at the bridge site and include existing bridge demolition activities and replacement bridge construction activities. Additionally, building demolition and removal activities will be required in Site 1 and Site 3 to support bridge construction and operation (**Attachment I, GEN-14**).

Site 1 consists of construction activities west of the navigation channel; it encompasses the 100-year floodplain and extends waterward to include the Mean Low Water (MLW), but landward of the navigation channel. Site 1 building demolition and removal activities include the following at 10 North Water Street (Parcels 2/19/2 and 2/19/3): the IMAX Theater; the Pedestrian Link, a covered walkway connecting the IMAX Theater and the Maritime Aquarium; a City of Norwalk diesel tank; the Maritime Aquarium tent; and a State of Connecticut septic tank.

Site 2 consists of construction activities within the navigation channel; Site 2 resources include the 100-year floodplain and subtidal area.

Site 3 consists of construction activities east of the navigation channel; it encompasses the 100-year floodplain and extends waterward to include the MLW, but landward of the navigation channel. Site 3 building demolition and removal activities include the SONO Wharf marina buildings and tent at the construction staging yard southeast of the bridge (on Parcel 3/1/25 (1 Goldstein Place). Additional required removals east of Site 3 include: the City of Norwalk Water Pollution Control Authority's temporary Contaminated Groundwater Treatment facility, located east of Parcel 3/2/6 (21 Goldstein Place); a building on Parcel 3/1/29 (4 Goldstein Place); and a building on Parcel 3/1/19 (6 Goldstein Place).

Site 4 is located approximately 100 yards south of the bridge site waterward of 4 North Water Street (Parcel 2/19/1) and is the current location of the docks of the Sheffield Island Lighthouse Ferry and Maritime Aquarium's research vessel, Spirit of the Sound. Site 4 consists of activities related to reconfiguring and lengthening the existing docking facilities of the vessels, which will provide operational flexibility as needed during construction and permanent water-dependent use improvements. Site 4 includes activities waterward of the Coastal Jurisdiction Line (CJL) but landward of the navigation channel.

Site 5 is located south of the Route 136/Stroffolino Bridge, less than 0.2 mile from the bridge site and directly waterward of 68 and 90 Water Street [Parcels 2/84/19 (portion) and 2/84/33]. CTDOT will construct a bulkhead and will utilize the site (including 70 Water Street, Parcel 2/84/63) to store construction materials and equipment, requiring demolition of an existing warehouse structure. Additionally, a temporary dock facility will be constructed for the berthing and passenger loading and unloading operations of the Maritime Aquarium and Sheffield Island Lighthouse Ferry vessels. Work at Site 5 includes activities waterward of the CJL, but landward of the navigation channel.

A new bulkhead is included in the project to provide construction flexibility. CTDOT is anticipating that construction of the bulkhead will not be required; however, to reflect worst-case impacts to resources, this construction activity is included.

Site 6 consists of six individual wetland mitigation areas in various locations along both riverbanks near the bridge. All tidal wetland mitigation areas are within the intertidal zone of the Norwalk River.

Sites 7 through 9 consist of the construction barge or work vessel mooring locations. Site 7 is located south of Veterans Memorial Park, approximately 1,000 feet from the bridge site. Work at Site 7 includes activities waterward of the CJL but landward of the navigation channel. Site 8 is located within the south anchorage basin east of the Norwalk Harbor navigational channel, approximately 0.6 mile from the bridge site. Site 9 is located in Long Island Sound, just west of Sheffield Island, approximately 3.8 miles from the bridge site. Sites 8 and 9 are waterward of MLW and located outside the navigation channel.

Site 10 is approximately 2.1 nautical miles south of Walk Bridge on the southern portion of Manresa Island. CTDOT will use approximately 4.7 acres on Parcel 5/86/1, the site of the de-commissioned NRG Energy power plant, for construction of the replacement bridge lift span bridges. Work at Site 10 includes barge mooring waterward of the CJL but landward of the navigation channel. Staging and storage yard activities at Site 10 are landward of the CJL and located in the 100-year floodplain.

Part III, Question 2a also provides tables of anticipated impacts to resource areas. Detailed project plates are provided in **Attachment I**. **Attachment I** includes general plans showing existing conditions (EP), proposed conditions (PP), and details of project construction activities.

4.2 Construction Approach

A primary goal of the Walk Bridge design and construction is to minimize disruptions to rail and river traffic. As such, the lift span was designed and configured to allow for four-track service to continue well into the construction period and for the swing span to remain operational for boat traffic until the first of the two lift spans is ready to be installed. For most of the project duration, it is anticipated that the river will remain open to traffic by restricting construction activity to one existing channel and keeping the other channel open to marine traffic. There will be certain construction activities that will require either a vertical restriction or a complete channel closure. Coordination with the United States Coast Guard Sector Long Island Sound and the Norwalk Harbormaster for channel restrictions and closures will be required for overall staging of barges and equipment during certain construction activities, including removal of the existing pivot pier, rest piers, and swing span; installation of the new lift spans; and installation and removal of the slide rail assemblies used for installing the new bridge elements.

Initial construction activities include installation of construction work platforms in the four quadrants of the bridge site, installation of mooring piles and temporary fender systems, and demolition of the existing control house. Cranes and other construction equipment placed on the temporary work platforms will be used to build the new lift span piers and lift span towers. The replacement bridge lift spans will be assembled at the Manresa Island Staging and Storage Yard and transported upstream along the Norwalk River via barge to the bridge site where they will be prepared for final installation. A temporary slide rail system supported on the southwest and southeast construction work platforms will be used to install the south lift span into its final position. The north lift span will be floated into its final position on a barge.

The swing span will be operational for river traffic during the initial bridge construction activities. These activities include removal of the south half of the existing bridge approach spans, construction of the south half of the approach spans, and assembly of the south lift span. Upon assembly of the south lift span and reconstruction of the south portion of the west approach, east approach, approach spans, and overhead contact system (OCS) structures, the navigation channel will be closed. The existing swing span will be

slid to the north and will be replaced by the first (south) lift span being slid in from the south via the slide rail system. The horizontal channel restriction will be lifted once the swing span and the swing span slide rails have been removed. The channel will be fully restored to navigation once the south lift span is made operational. Upon assembly of the north lift span and reconstruction of the north portion of the west approach, east approach, approach spans, and OCS structures, the navigation channel will be closed. At this time, the north lift span will be floated under the new south lift span (in the raised position) for final installation. During this phase, the channel will be vertically restricted prior to the north lift span becoming fully operational, but otherwise it will open for river traffic.

Based on additional design refinement, CTDOT anticipates implementing an alternative approach to removing the existing swing span to reduce temporary impacts to resources and navigation.

4.3 Construction Methodology

Construction of the in-water portions of the project will be primarily completed with cranes and other equipment placed on construction work platforms in the four quadrants of the bridge site. Crawler-type cranes positioned on the work platforms will facilitate the following: removal of the existing approach superstructure; erection of new approach superstructure and substructure; and erection of new lift span foundations, towers, counterweights and bridge mechanical and electrical components. The cranes will be accompanied by material barges and a collection of helper boats and work shuttle vessels. The placement of the floating marine construction equipment will be such that either the east or west channel of the existing swing span will remain accessible for navigation prior to the installation of the first vertical lift span truss. Once the first lift span truss is in service, barge placement will be predicated on accessing the existing substructure units during their removal, while maintaining at least half of the channel for navigation.

Removal and disassembly of existing Walk Bridge includes the bridge superstructure and substructure. The existing bridge superstructure consists of the bridge approach spans, swing span, open deck track, control house, and seven OCS structures. These elements will be removed in their entirety. The existing bridge substructure consists of the east and west abutments, Pier 1 (east of North Water Street), Pier 2 (west swing span rest pier), the pivot pier, and Pier 3 (east swing span rest pier). The east and west abutments and Pier 1 are landward of the CJL; Piers 2 and 3 and the pivot pier are below the CJL. The piers in the river consist of stone masonry founded on timber piles and timber matting. The pier masonry and timber matting will be removed to the bottom of the timber mat, Elevation -20.0 (NAVD88). Pier 1 will be removed to approximately Elevation 4.0 to 6.0 (NAVD88), which is 2 feet below ground elevation which varies between Elevation 6.0 and 8.0 (NAVD88). The existing bridge foundations in the river (Piers 2 and 3 and the pivot pier) will be removed to Elevation -14.98 (NAVD88), which is 1 foot below the authorized dredge elevation of -13.98 (NAVD88), to accommodate an allowance for over-dredging.

Transmission towers (Structures 529 and 530) on the east and west sides of the bridge will be removed in their entirety, along with the overhead lines that cross the navigation channel. All open deck track on the existing bridge will be removed with the structure. Three existing submarine cables will be deactivated and removed in their entirety; these include the cable providing electrical power and control to the existing swing span, a temporary railroad signal and communication cable installed as part of the CP-243 Interlocking Project, and the signal express cable. The existing timber fender protection system includes

timber protection for Piers 2 and 3 and the pivot pier. At each pier, the protection system, including the timber piles, will be completely removed.

Upon completion of the existing pier demolition, the marine enclosures will be removed and the surface around the piers will be dredged to the final channel depth to match the existing federal navigational channel as approved by the USACE. The dredging activity will include a crane with a clamshell bucket and/or excavator working from the crane barge and loading the material barge to one of the platforms for off-loading.

The eastern construction work platforms will be used for initial loading of dredged sediment, existing bridge superstructure and substructure parts, and other construction material from construction barges. The Manresa Island Staging and Storage Yard (Parcel 5/86/1) and the construction yard at the bridge site (1 Goldstein Place, Parcel 3/2/25) will be used for off-loading of existing bridge components and other construction material from the construction barges. The construction yard at the bridge site also will be used for initial off-loading and transfer of dredged sediment to CTDOT-designated upland Waste Stockpile Areas (WSAs) for testing and management prior to off-site disposal.

The permanent fenders for Pier 2 and Pier 3 will be pier-mounted, consisting of a Super Cone/panel unit fender system which provides a high energy absorption capacity. In addition to the pier-mounted fendering system for Pier 3, a pile-supported fender system will be installed to protect the control house, situated on the northern end of Pier 3.

The Walk Bridge Replacement Project will generate dredged and excavated sediment from the Norwalk River and excavated material from upland locations. Sediment handling will be conducted per the contract specifications and permits. Sediment removed from the Norwalk River will be transported to CTDOT-designated upland Waste Stockpile Areas (WSAs) for testing and off-site disposal. Dredged material will not be reused on the project site. For other excavation in the river (except for the recently installed CP-243 Interlocking Project submarine cable removal), the top four feet of material excavated from the current top of river sediment will be transported to the WSAs, where the material will be tested and disposed off-site. Material below the top four feet of excavation can be returned to the trench from where it came. Excavated material from upland locations, such as the railroad embankment, may be reused on the project site. Material removed from these locations will be transported to CTDOT-designated upland Reuse Stockpile Areas (RSAs) for testing. The RSAs will be used to stockpile excavated material and blend stone (if needed) until its reuse on the project site. The WSAs and RSAs will be managed in accordance with the CTDEEP General Permit for Contaminated Soil and/or Sediment Management (Staging and Transfer). Additionally, the stockpile areas will be included in the Walk Bridge Program Stormwater Pollution Control Plan (SWPCP) and covered under the CTDEEP General Permit for Stormwater Discharges from Construction Activities. Wastewater generated during dewatering activities will be managed in accordance with CTDEEP requirements.

Section 7 of this Executive Summary describes the time of year restrictions and environmental protection measures (BMPs) that will be implemented to protect resources during project constructions. Further details are provided in **Part III, Questions 1 and 2**.

5. Summary of Impacts to Coastal/Aquatic Resource Areas

Drawings SUM-1 and SUM-2 in Attachment I report the area (square footage) of impact to river bottom within the subtidal and intertidal zones and the volume (cubic yards) of sediments to be dredged/removed during trench excavation. Impacts with durations less than 24 months are considered temporary. Impacts due to temporary fill and/or structures that are expected to be in place more than 24 months are considered permanent. Dredging impacts include maintenance dredging and new dredging. Maintenance dredging includes all material within the navigation channel and dredging side slope limits. New dredging includes all material that is not defined as maintenance dredging.

Impacts to various resources that exist in the project area are summarized as follows, with further details provided in **Part III, Questions 4, 5 and 6** of the permit application.

5.1 Intertidal Flats

Intertidal flats exist upstream from Walk Bridge on both sides of the river and smaller exposed intertidal areas exist on both the east and west shores of the Norwalk River near the abutments of the Walk Bridge. However, these smaller areas do not qualify as mudflats by definition, as the substrate is comprised more of a coarse sand/cobble mix and the grade of these areas is not gently sloping or flat. Compensation for impacts to intertidal flats at the bridge site is described in Section 5.2

Intertidal flats exist on the eastern and western sides of Manresa Island. On the eastern side of the island, the flats border the Norwalk River; and on the western side of the island, the flats border the Outer Harbor area. The project will not impact intertidal flats at Manresa Island.

5.2 Vegetated Tidal and Freshwater Wetlands

Vegetated tidal wetlands are located along the east and west sides of the Norwalk River, both north and south of the bridge. In the vicinity of the bridge site, vegetated tidal wetlands are representative of estuarine vegetative communities typically deemed salt tolerant, such as smooth cordgrass (*Spartina alterniflora*), salt meadow grass/hay (*Spartina patens*), high-tide bush (*Iva frutescens*), water hemp (*Amaranthus cannabinus*), seaside goldenrod (*Solidago sempervirens*), and marsh orach (*Atriplex patula*). The prominent species in the vicinity of the bridge is smooth cordgrass. No freshwater wetlands exist proximate to the bridge site.

Compensation for permanent impacts to the vegetated tidal wetlands and intertidal mudflats will be largely in the form of mitigating tidal wetland areas within the intertidal zone, with some enhancement areas located landward of the high tide line. The loss of vegetated tidal wetlands and intertidal mudflats will be mitigated through treatment and removal of invasive common reed (*Phragmites australis*) in existing tidal wetlands, restoration of degraded vegetated tidal wetlands dominated by *Phragmites*, and restoration of a low-functioning intertidal flat previously impacted by riprap placement. The mitigation plan also will include listed species enhancements and improvements to the overall water quality of the Norwalk River. The proposed mitigation areas exist along the Norwalk River, proximal to, but outside of the immediate vicinity of Walk Bridge.

Both tidal and freshwater wetlands are located in the undeveloped, overgrown, and wooded northern parcel of Manresa Island, and along the shore on both sides of the island, extending to the southern portion of the island. There are no tidal or freshwater wetlands in the proposed Staging and Storage Yard. Adjacent tidal marshes include low marsh vegetation consisting of smooth cordgrass and high marsh vegetation consisting of salt meadow grass/hay, and high-tide bush, with a common reed perimeter as the marsh slopes to the upland area. The project will not impact tidal or freshwater wetlands at Manresa Island.

5.3 Estuarine Embayments/Nearshore Waters

Located within the tidally influenced Norwalk River, the project site is partially protected and maintains an open connection to the sea. The project site is a small area within a much larger estuarine embayment. There will be a net increase in available estuarine embayment and in available nearshore water benthic habitat following this project. Construction period impacts are anticipated; however, these activities will not adversely impact the overall estuarine environment/nearshore waters.

Based on subsurface investigations in the Norwalk River conducted in June 2018, the Norwalk River is identified as a preliminary Area of Environmental Concern (AOEC). Sediment dredged from the Norwalk River will not be reused on site; it will be transported to the CTDOT-designated upland WSAs for testing and off-site disposal per the contract specifications and permits.

5.4 Coastal Hazard Areas

The project site is located within the tidal reach of the Norwalk River near the river's mouth into Long Island Sound. As such, the bridge is influenced by both riverine events and coastal storm surges. The Walk Bridge is located in Federal Emergency Management Agency (FEMA) Zone AE, defined as the 100-year floodplain or as areas subject to inundation by the 1-percent-annual-chance flood event. Walk Bridge is approximately 500 feet upstream of the Route 136 Bridge (Stroffolino Bridge); the boundary of Zone VE, defined as areas subject to inundation by the 1-percent-annual-chance flood event with additional hazards due to storm-induced velocity wave action, is just south of the Stroffolino Bridge and extends south to include the Norwalk Harbor at Manresa Island.

The replacement of Walk Bridge within the 100-year and 500-year floodplains will not result in any adverse impacts to the floodplains, nor will it alter the hydraulic and erosive characteristics of the river within the project area. Hydraulic models of the bridge site in both the existing and proposed conditions have been performed to verify that replacement of the existing bridge will not adversely impact the hydraulic characteristics of the Norwalk River at and in the vicinity of the bridge site, including water surface elevations and flood velocities. Hydraulic modeling was not required for the project's construction staging and storage yards. Temporary fill will be placed in the construction staging parcels; however, the temporary fill will be placed only in a tidal floodplain and not in a fluvial floodplain. Further, the volume of fill at the sites is not substantial enough to result in adverse impacts to the depth, velocity, or flow patterns during a storm surge event.

5.5 Developed Shorefront

The surrounding riverbanks in the vicinity of Walk Bridge and the Manresa Island Staging and Storage Yard are defined as developed shorefront. This project will include unavoidable construction phase shorefront disturbances and limitation to water access, primarily due to the use of construction work

platforms throughout the duration of the project and the need for construction staging, storage areas, and access at and near the bridge site. At the Manresa Island Staging and Storage Yard, use of the developed shorefront will include berthing of construction and material barges for assembly of the replacement bridge lift spans and transfer of existing bridge components for staging and temporary storage, as well as berthing of safety boat vessels and emergency rescue operations associated with construction. At the completion of the project, the construction sites will be restored to their pre-construction conditions or stabilized with seed and mulch for erosion control.

Following the completion of this project, the Norwalk River's developed shorefront will result in overall improvements. A new waterside pedestrian/bicycle path will be constructed on the east bank of the Norwalk River, connecting to the Norwalk River Valley Trail. Waterward of 4 North Water Street, the reconfigured new dock and gangway facilities for the Sheffield Island Lighthouse Ferry and the Maritime Aquarium's research vessel will improve waterfront facilities for these operators and the accessible¹ gangway will enhance this water-dependent use in downtown Norwalk. Additionally, the removal of the piles waterward of 68 and 90 Water Street (Parcels 2/84/19 and 2/84/33), including some from abandoned and deteriorated docks, will improve the developed shorefront, including opportunities for future waterfront development. Further, for those parcels with waterfront access that were acquired for project construction, upon construction completion, CTDOT will market the excess property indicating the highest priority and preference for water-dependent use of the site. There are opportunities for these parcels to be redeveloped with water-dependent uses, a priority use of waterfront parcels per the Norwalk Harbor Plan and the Connecticut Coastal Management Act.

5.7 Shellfish Concentration Areas

The Norwalk River extending south to the Norwalk Outer Harbor is a State-designated natural shellfish bed. Shellfish of economic importance are not expected to occur along the bottom of the Norwalk River Federal Navigation Channel in the soft unconsolidated sediment, however, shellfish resources do occur in the intertidal and subtidal zones adjacent to the channel.

Because shellfishing currently is prohibited in the Norwalk River and Harbor, no adverse impacts to harvestable shellfish will result from the project. Additionally, any impact to natural shellfish beds in the area of Walk Bridge will be minimized with the following mitigation measures: 1) dredging/excavation within a turbidity curtain will only occur between December 1st and January 31st; 2) dredging/excavation outside of the December – January window will occur within a marine enclosure enclosed by a turbidity curtain; and 3) no unconfined turbidity-producing activities will be allowed between February 1st and September 30th. Collectively, these measures will minimize potential impacts to resources.

5.8 Aquatic and Terrestrial Resources and Habitat

Several species of plants, fish, birds, invertebrates, and mammals use the Norwalk River for food, shelter, and nursery grounds. The Norwalk River is known migratory route for many diadromous species. Per the National Oceanic and Atmospheric Administration (NOAA) Essential Fish Habitat (EFH) mapper (April 2020) and consultation with CTDEEP Marine Fisheries Program (throughout project design) EFH for eighteen species exists in the project area, including Walk Bridge, the Norwalk River, Norwalk Inner Harbor, Norwalk Outer Harbor, and western Long Island Sound to Manresa Island. According to the

¹ Accessible refers to compliance with The Americans with Disabilities Act.

December 2020 CTDEEP Natural Diversity Data Base (NDDDB) map and consultation with USFWS IPaC, the Walk Bridge project, inclusive of the wetland mitigation areas at Oyster Shell Park and extending south to the Manresa Island Staging and Storage Yard, is designated as state and federal species habitat.

Overall, minor adverse short-term impacts are anticipated to indigenous fish species during periods of active construction. Fish will be hindered from using habitat in the project area when barges and other construction equipment are actively excavation/dredging, pile driving/extracting, and/or shaft and micro pile drilling. Short term conditions potentially affecting fish include increased turbidity in the water column (which will be limited or controlled with the installation of turbidity curtains or turbidity curtains and marine enclosures depending on the time of year) and increased sound pressure levels from underwater construction activity. Impacts from the latter (underwater construction noise) have been thoroughly researched and documented in the NOAA NMFS Section 7 informal consultation and the EFH Assessment prepared for this project.

CTDOT has coordinated with the NOAA/NMFS/GARFO's Protected Resources Division (PRD) and Habitat and Ecosystem Services Division (HESD); CTDEEP Bureau of Natural Resources, Land and Water Resources, NDDDB, Wildlife Division, and Fisheries Division – Marine Fisheries Program; Norwalk Shellfish Commission (NSC); the Norwalk Harbor Management Commission (NHMC); and the U.S. Army Corps of Engineers (USACE) in developing environmental protection measures for the project. By implementing time of year (TOY) restrictions, protection strategies, and other BMPs, no adverse effects on indigenous finfish/EFH species, ESA-listed fish species, or state-listed terrestrial species are anticipated.

5.9 Benthic Habitat

The waters in and around the project site, consisting of Norwalk River, the Norwalk Inner Harbor, and the Norwalk Outer Harbor, serve as habitat for multiple benthic species. The more common marine algae (seaweeds) likely found in the project vicinity include green algae (*phyla Chlorophyta*) and brown algae (*phyla Phaeophyta*), both of which occupy the shallower areas. CTDOT has determined that no populations of submerged aquatic vegetation (SAV), such as common eelgrass (*Zostera marina*), widgeongrass (*Ruppia maritima*), or any other non-algae submerged aquatic plant species, exist in and around the Walk Bridge.

Direct removal of the benthic substrate via dredging/excavation and drilled shaft/center support structure construction for the two lift piers will be necessary. The resulting disturbance footprints will be small when compared to the total area of existing Norwalk River benthic habitat, which has been subject to larger scale disturbances in the past. Adverse impacts to benthic invertebrate communities and Essential Fish Habitat (EFH) from this project are therefore anticipated to be minor. Adverse permanent short-term impacts will include the removal of benthic species inhabiting the project footprints, as they will be excavated along with river bottom sediments and removed from the site for upland disposal. However, after dredging/excavation activities are completed, similar benthic species are anticipated to return and recolonize the disturbance footprint. Recolonization of the disturbance footprints by algae and benthic organisms is expected to begin almost immediately following construction activities. The unconfined dredging activities will be scheduled to conclude before spring, allowing recolonization to coincide with steadily increasing water temperatures and light penetration with the onset of the spring and summer seasons.

6. Summary of Impacts to Coastal Activities

6.1 Use and Development of Adjoining Uplands

The project will have minor impacts on adjoining upland communities/habitat. Existing upland vegetation will be lost due to clearing and grubbing during construction work along both bridge approaches. The entire area within the limit of disturbance will be cleared, resulting in the removal of existing vegetation and stumps. This removal is considered a permanent impact (i.e., loss of woody plant coverage within the project area). Although the existing trees and shrubs will be permanently removed, this is not anticipated to be a significant negative ecological impact due to the limited extent of the trees being removed, the largely non-native community composition, and the poor quality of the habitat affected (largely ruderal habitat that grew atop a filled slope). Loss of herbaceous coverage will be temporary, since upon completion of the bridge approach widening construction activity, all exposed bare soil areas will be stabilized via re-seeding.

6.2 Use and Development of Adjoining Lands and Properties

The project will require the use of lands and properties adjoining the project site, along the Norwalk River, and along the railroad right-of-way (ROW) for the construction and operation of the replacement bridge. The parcels will be used for temporary storage of construction equipment and supplies, assembly of large components of the new bridge and staging of equipment, storage of components of the dismantled existing bridge, access to the Norwalk River and streets for transport of equipment and materials, access to the railroad ROW, dredged/excavated sediment initial off-loading and transfer, access to the bridge for maintenance, and to accommodate project designs and bridge operations. CTDOT is acquiring parcels through full and partial parcel acquisitions and full or partial parcel construction easements.

Following construction completion, acquired parcels will be sold per CTDOT's Office of Rights of Way Property Management Division. Some permanent easements near the bridge will be necessary for bridge operation and maintenance. CTDOT will provide monetary and other relocation assistance to displaced property owners in accordance with the procedures outlined in the Uniform Relocation Assistance and Real Property Acquisition Policies Act of 1970 and Connecticut's Uniform Relocation Assistance Act. For acquired waterfront parcels, CTDOT will select the highest bid that best demonstrates an integrated, quality, water-dependent use, in coordination with CTDEEP. There are opportunities for these parcels to be redeveloped with water-dependent uses, a priority use of waterfront parcels per the Norwalk Harbor Plan and the Connecticut Coastal Management Act.

In the case of the parcels immediately adjacent to the bridge, CTDOT will retain permanent easements for access to the bridge for future operation and maintenance. Except for 10 North Water Street (Parcel 2/19/2, IMAX Theater), temporary construction easements will cease upon project completion, and properties will be restored to pre-construction conditions. The full use of Parcel 2/19/2 as a temporary easement will result in the displacement and demolition of the IMAX Theater. To mitigate impacts and compensate for the loss of the facility, CTDOT has entered into an agreement with the City of Norwalk allowing for the future development of a functional replacement facility. In coordination with the City of Norwalk, the Maritime Aquarium of Norwalk is responsible for constructing the functional replacement facility, including conducting environmental evaluations and preparing permit applications.

6.3 Improvement of Coastal and Inland Navigation for all Vessels, Including Small Craft for Recreational Purposes

The project will improve marine traffic conditions in the Norwalk River. With the new vertical lift bridge, the reliability of bridge operations will be substantially improved. The proposed increased bridge height will reduce the frequency of bridge openings, which will benefit commercial and recreational marine users.

The elimination of the center pivot pier that divided the navigation channel at the existing Walk Bridge will result in an effective increase in the width of the navigation channel of the replacement bridge, improving passage through the replacement bridge. The widened channel at Walk Bridge via the removal of the pivot pier and fender system also will improve rowing conditions and rower (and other small boat) safety, by providing more visibility for rowers and boaters. The required channel maintenance dredging to the authorized dredge depth will straighten the alignment between Walk Bridge and the Stroffolino Bridge and improve the navigability of the river between and through the two bridges, improving overall conditions for large and small vessel users.

CTDOT has coordinated extensively with the City of Norwalk, the Norwalk Harbor Management Commission, the Norwalk Harbormaster, and waterway users regarding construction work within the water and potential impacts on navigation and water-dependent uses. In consultation with water-dependent users of the Norwalk River, including rowing clubs, marinas, and other commercial interests, CTDOT has developed a Marine Use Plan to minimize the adverse impacts of construction on marine transportation and to develop water-dependent use/waterfront access strategies to mitigate impacts that cannot be avoided.

6.4 Water Quality

CTDOT obtained Norwalk River sediment samples in 2016 to characterize the river sediments at the bridge site. Based on testing results, the Norwalk River is identified as a preliminary Area of Environmental Concern (AOEC). Chemical constituents detected in the sediment of the Norwalk River include the following: Extractable Total Petroleum Hydrocarbons (TPH), Semi-volatile Organic Compounds (SVOCs), Polychlorinated Biphenyls (PCBs), and metals (arsenic and lead). Because of this contamination, handling and permitting clearances that comply with CTDEEP standards will be followed to protect aquatic resources. Sediment impacted by chemical constituents will be dredged, managed, and disposed of at an upland location in accordance with state and federal regulations. Water resulting from the dewatering/decanting process will meet CTDEEP discharge permit performance standards/requirements prior to being discharged back into the Norwalk River.

Project activities at the Manresa Staging and Storage Yard will not affect site groundwater, which has been impacted by historic power plant operations.

CTDOT will implement water quality monitoring for all in-water work during the construction project. Baseline monitoring will be utilized to establish trends and background levels that will assist in the exceedance reporting and investigations during construction monitoring. Turbidity monitoring during construction will be conducted on a continuous basis in the vicinity of each turbidity producing activity. Monitoring will be conducted upstream from the bridge site via two fixed monitors to act as a baseline and two floating monitoring locations both upstream and downstream of the marine enclosures/turbidity curtains to serve as the monitors during the ebb and flow of the river. If there is a spike in turbidity levels

above the action levels, an environmental inspector will be available on the project to investigate the cause of the exceedance to determine if the condition is due to natural conditions of the river, background traffic in the area, or from the construction activities. As necessary, the BMPs implemented by the contractor will be adjusted. CTDOT will also be monitoring specific conductivity, salinity, dissolved oxygen, pH, temperature, and water level to determine if marine life and other natural conditions may be contributing to turbidity levels.

Water quality within the Norwalk River will improve due to the project's wetland mitigation at six areas along the riverfront.

6.5 Water Circulation and Drainage

To ensure that the proposed bridge will not have an adverse impact to the 100-year design floodplain, the proposed conditions hydraulic flood model (60 percent design) was compared to the existing conditions flood model. The results of the models indicate that the 100-year water surface elevations will be reduced at and in the vicinity of the bridge site, except at the downstream face of Walk Bridge where water surfaces will increase by 0.01 feet. Due to the removal of the large existing pivot pier, combined with the removal of the existing rest piers and the placement of the proposed lift span piers, the 100-year flood velocities will decrease between 0.02 and 0.38 feet/second at the bridge site. Therefore, the project will reduce the risk to future damage including property and loss of human life. During the 500-year storm event, modeling indicates that water surface elevations in the proposed conditions are within 0.03 feet of the existing elevations. Similar to the 100-year storm event, the proposed bridge will provide over 15 feet of under clearance during the 500-year storm event.

As cited in Section 5.4, fill will be placed within the FEMA floodplain at the project construction staging and storage parcels; however, the fill will be located within the tidal floodplain with no riverine (fluvial) impacts. Further, the volume of fill at the sites is not substantial enough to result in adverse impacts to the depth, velocity, or flow patterns during a storm surge event.

6.6 Recreational Use of Public Water

For most of the project duration, it is anticipated that the river will remain open to traffic, including recreational use, by restricting construction activity to one existing channel and keeping the other channel open to marine traffic. There will be construction periods when river traffic will be restricted (via a vertical restriction) or closed, however. CTDOT has prepared a Marine Use Plan, in consultation with water-dependent users of the Norwalk River, including rowing clubs, marinas, and other commercial interests, to minimize the adverse impacts from construction on marine transportation and to develop mitigation measures and strategies to mitigate impacts that cannot be avoided.

6.6 Public Trust Lands

Public trust lands adjacent to the project site include the Norwalk River Valley Trail (NRVT) on the west side of the river and the NRVT Harbor Loop Trail on the east side of the river. While project construction activities, including compensatory wetland mitigation, will impact portions of the NRVT on both sides of the river, in the permanent condition, the project will improve public access to and use of public trust lands near the bridge. This project will facilitate expansion of the coastal access network along the east side of

the Norwalk River, providing waterfront access mitigation. CTDOT will construct an eastern path connection of the Norwalk Harbor Loop Trail via the existing and partially lowered eastern abutment of the existing bridge. Additionally, CTDOT is constructing a series of interpretive panels to be located near Walk Bridge, including along the bicycle paths and in public trust areas. The interpretive panels will enhance the public use and enjoyment of public trust areas near Walk Bridge.

6.7 Water Dependent Uses

The navigation improvements provided by this project will benefit existing water-dependent uses, particularly upriver commercial marine uses and vessels with restricted maneuverability. With the new vertical lift bridge, the reliability of bridge operations will be substantially improved. The proposed increased bridge height of approximately 26 feet above MHW (when closed) will reduce the frequency of bridge openings, which will benefit commercial and recreational marine users. With the removal of the center pivot pier, the new bridge will offer a horizontal clearance of 220 feet between the pier-mounted fenders, which will facilitate easier barge and tow operations through the bridge. The widened channel at Walk Bridge via the removal of the pivot pier also will improve rowing conditions and rower (and other small boat) safety, by providing more visibility for rowers and boaters. Additional dredging will straighten the alignment between Walk Bridge and the Stroffolino Bridge to improve the navigability of the river between and through the two bridges, improving overall conditions for large and small vessel users.

Following the completion of this project, the Norwalk River's water dependent development activities and opportunities in the vicinity of Walk Bridge will experience overall improvements. Following construction completion, all acquired parcels will be sold by CTDOT's Office of Rights of Way Property Management Division. For waterfront parcels (11 Goldstein Place – Parcel 3/1/25, zoned Industrial; and 90 Water Street - Parcel 2/84/33, zoned Marine Commercial), CTDOT will select the highest bid that best demonstrates an integrated, quality, water-dependent use, in coordination with CTDEEP. There are opportunities for these two parcels to be redeveloped with water-dependent uses, in compliance with City of Norwalk planning regulations.

7. Summary of Environmental Protection Measures and Compensatory Mitigation

7.1 Environmental Protection Measures

Through coordination with NOAA/NMFS/GARFO, CTDEEP, USACE, and the NSC, CTDOT has agreed to implement the following environmental protection measures, consisting of time of year restrictions and resource protection measures, during construction of the project.

Construction of the Walk Bridge Replacement Project will include land-based activities and in-water work. In-water work will consist of, but not be limited to, the installation of permanent and temporary structures, removal of permanent and temporary structures, placement of fill, and dredging below the Coastal Jurisdiction Line (CJL). Incidental activities such as, but not limited to, the placement of mooring buoys, movement of construction vessels, and spudding (securing of) construction vessels is not considered in-water work.

Time of Year Restrictions:

- All pile driving and extraction (including sheet piles) activities conducted between April 1st and June 30th will only occur between one hour after sunrise to one hour before sunset. (Per coordination with CTDEEP Marine Fisheries, shaft drilling and micro pile drilling conducted within a caisson and marine enclosure are not subject to this TOY restriction.)
- No unconfined turbidity producing activities will be allowed between February 1st and September 30th.
- A soft start will be required between March 16th and October 31st. A soft start will be used at the beginning of each shift that requires pile driving and extraction (including sheet piles) activities, whether located within or outside of a marine enclosure, as well as following cessation of activity for a period of 30 minutes or longer. A soft start is defined as follows:
 - For impact pile driving: pile driving will commence with an initial set of three strikes by the hammer at 40% energy, followed by a one-minute wait period, then two subsequent three-strike sets at 40% energy, with one-minute waiting periods, before initiating continuous impact driving.
 - For vibratory pile installation: pile driving will be initiated for 15 seconds at reduced energy followed by a one-minute waiting period. This sequence of 15 seconds of reduced energy driving, one-minute waiting period will be repeated two additional times, followed immediately by pile-driving at full rate and energy.
- Dredging will be conducted within a turbidity curtain between December 1st and January 31st. Dredging from February 1st through November 30th will be conducted within a marine enclosure enclosed by a turbidity curtain.
- No construction and/or inspection activities which are within 400 feet of an identified peregrine falcon (*Falco peregrinus*) nest will be permitted during nesting season, between April 1st and July 31st.
- Use of the Manresa Island Staging and Storage Yard will be started before April 15th or after August 1st to allow for the nesting ospreys (*Pandion haliaetus*), to acclimate to this new activity within their nesting areas.
- Special precautions, within Manresa Island (will be implemented during the Northern diamondback terrapin's (*Malaclemys t. terrapin*), active season from April 1st through October 31st, in accordance with CTDOT Section 1.10 Environmental Compliance.

Resource Protection Measures:

- Pile driving/extraction activities will be coordinated to ensure that that the navigation channel is available for marine traffic and fish passage; activities will occupy less than 50% when working in the middle of the navigation channel.
- Barge movements will take place such that there will be no adverse impacts to the river bottom or increase in ambient turbidity beyond that allowed by permit conditions.
- Marine enclosures will be installed prior to the start of certain construction activities. Marine enclosures are steel sheet pile structures that are not to be considered as being watertight. The sheeting allows low velocity flow between the enclosure and the outer tidal waters; the elevation of water inside the enclosure is isolated from tidal waters and therefore lags the tide. The marine enclosure will be installed so that the top of the enclosure is at or above Elevation 6.2 (NAVD), one foot above the high tide line. All marine enclosure will be protected from navigation impacts with a temporary fender system. The temporary fender system, consisting of mooring piles and floating fenders between the mooring piles, will line the channel faces of the marine enclosure. To further prevent siltation outside of the marine enclosure, a turbidity curtain will be deployed around its exterior perimeter.

- All pile driving and extraction (including sheet piles) activity will be enclosed within turbidity curtains.
- Type 3 Permeable Turbidity Barriers will be used (CTDOT Specification Item # 0210306A-Turbidity Control Curtains). If needed, pin piles will be used to hold the turbidity curtains in place. Turbidity curtains will be installed prior to the start of the following activities:
 - o Marine enclosure installation,
 - o Pier construction (with marine enclosure),
 - o Pier removal (with marine enclosure),
 - o Existing submarine cable removal,
 - o Slide rail installation and removal for swing span removal,
 - o Control house independent fender system installation and existing fender removal,
 - o Navigational/maintenance dredging,
 - o Construction platform pile driving,
 - o Pile installation and removal at the temporary vessel dock relocation sites,
 - o New dredging (with marine enclosure if outside the dredging work window) at the temporary vessel dock relocation site [waterward of 68 and 90 Water Street (Parcels 2/84/19 and 2/84/33)] and at the permanent vessel dock location site [waterward of 4 North Water Street (Parcel 2/19/1)],
 - o Bulkhead installation at 68 and 90 Water Street,
 - o Sheet pile installation and outfall reconstruction at the IMAX,
 - o IMAX Theater foundation removal (with marine enclosure),
 - o Wetland restoration.
- The marine enclosures and turbidity curtains will be installed and maintained by the contractor. Prior to removal of the marine enclosure following each activity, the water inside the marine enclosure will be monitored for total suspended solids. Once the turbidity readings reach equilibrium with those readings outside of the turbidity curtain, then the marine enclosure can be removed. The turbidity curtains will remain in place until that portion of the project is complete and the turbidity has settled to no more than pre-construction conditions.
- Explosives and hydraulic breakers (e.g., jackhammers and hoe rams) will not be used below the high tide line (HTL).
- Water quality monitoring for turbidity, specific conductivity, salinity, dissolved oxygen, pH, temperature and water level (at one location) will be conducted whenever in-water work is being performed, as directed by CTDOT Section 1.10 Environmental Compliance.

7.2 Compensatory Mitigation

The Walk Bridge Replacement Project will result in permanent impacts to approximately 8,500 square feet of vegetated tidal salt marsh wetland and 200 square feet of intertidal flat, totaling 8,700 square feet (0.20 acre) that will require a 4:1 mitigation ratio, resulting in 34,800 square feet of required mitigation. Compensation for permanent impacts to the vegetated tidal wetlands and intertidal mudflats due to construction of the project will be in the form of mitigating tidal wetland areas within the intertidal zone. The loss of vegetated tidal wetlands and intertidal mudflats will be mitigated through treatment and removal of invasive common reed (*Phragmites australis*) in existing tidal wetlands, the restoration of degraded vegetated tidal wetlands dominated by *Phragmites*, and by restoration of a low-functioning intertidal flat previously impacted by riprap placement.

The areas proposed for mitigation are located along the Norwalk River, proximal to, but outside of the project's immediate vicinity. The proposed mitigation areas cover a total of 61,990 square feet (1.42 acres), which is sufficient to compensate for the 34,800 square feet (0.80 acre) of required mitigation. These areas include 43,200 square feet (0.99 acre) that will be restored within existing tidal wetland boundaries which contain salt marsh vegetation, stands of *Phragmites*, and riprap with scattered patches of smooth cordgrass. In addition, 18,790 square feet (0.43 acre) will be newly created or restored tidal wetlands outside of existing tidal wetland boundaries.

The proposed mitigation areas will be restored to emulate the existing vegetated tidal wetlands that are located along the shores of the Norwalk River in the Walk Bridge vicinity and adjacent to the proposed mitigation areas, to include salt marsh vegetation (dominated by smooth cordgrass: *Spartina alterniflora*) with an absence of invasive common reed. The proposed mitigation areas will provide a higher level of the same functions and values as those wetland areas impacted. Further, restoring the tidal wetland habitats is expected to improve the quality of these estuarine resources, thereby providing enhanced suitable habitat for several fish and wildlife species.

8. Project Construction Schedule

The project construction start is dependent upon the receipt / approval of environmental permits. The anticipated start date is fall 2021. Activities will be conducted in conjunction with all time-of-year-restrictions in place to protect species and the environment. Project construction is anticipated to take approximately five to six years to complete.

Project: CTDOT 301-176, Construction of a Movable Vertical Lift Bridge to Replace Existing Movable Bridge for the New Haven Line RR Bridge Crossing the Norwalk River in Norwalk, Connecticut
NDDB Determination No.: 201906405

Dear Christopher Samorajczyk,

I have reviewed Natural Diversity Data Base maps and files regarding the area delineated on the map provided for CTDOT 301-176, Construction of a Movable Vertical Lift Bridge to Replace Existing Movable Bridge for the New Haven Line RR Bridge Crossing the Norwalk River in Norwalk, Connecticut. I do not anticipate negative impacts to State-listed species (RCSA Sec. 26-306) resulting from your proposed activity at the site based upon the information contained within the NDDB and your application materials. The result of this review does not preclude the possibility that listed species may be encountered on site and that additional action may be necessary to remain in compliance with certain state permits.

Thank you for including in your NDDB application materials that CTDOT-OEP has coordinated extensively with the National Marine Fisheries Service as well as CTDEEP-Fisheries Division to protect blueback herring, diadromous species, sturgeon and shellfish. The coordination has resulted in no unconfined in-water work will occur between February 1st through November 30th. Although no confirmed nesting has occurred by State Threatened *Falco peregrinus* (peregrine falcon) since 2015 in the immediate vicinity of this project, these birds may move back to the area. If this occurs and peregrine falcon are observed in the direct work area, please implement the CTDOT-OEP best management practices for peregrine falcon and report the observations to our NDDB Program. Thank you for letting us know that coordinated discussions with the Maritime Aquarium scientists have led to CTDOT-OEP designing an extensive mitigation package that includes a State Special Concern Diamondback terrapin nesting berm. Please provide a copy of this proposed diamondback terrapin mitigation measure for inclusion in our CTDEEP NDDB maps and files.

This determination is good for two years. Please re-submit an NDDB Request for Review if the scope of work changes or if work has not begun on this project by May 23, 2021.

Natural Diversity Data Base information includes all information regarding critical biological resources available to us at the time of the request. This information is a compilation of data collected over the years by the Department of Energy and Environmental Protection's Natural History Survey and cooperating units of DEEP, private conservation groups and the scientific community. This information is not necessarily the result of comprehensive or site-specific field investigations. Consultations with the Data Base should not be substitutes for on-site surveys required for environmental assessments. Current research projects and new contributors continue to identify additional populations of species and locations of habitats of concern, as well as, enhance existing data. Such new information is incorporated into the Data Base as it becomes available. The result of this review does not preclude the possibility that listed species may be encountered on site and that additional action may be necessary to remain in compliance with certain state permits.

Please contact me if you have further questions at (860) 424-3592, or dawn.mckay@ct.gov. Thank you for consulting the Natural Diversity Data Base.

Sincerely,

Dawn M. McKay

Project: CTDOT Project # 301-176, Use of Manresa Island as Staging Area for Building Replacement of Metro North RR Walk Bridge over the Norwalk River in Norwalk, Connecticut
NDDB Determination No.: 202005282

Dear Christopher Samorajczyk,

I have reviewed Natural Diversity Data Base maps and files regarding the area delineated on the map you provided for the proposed CTDOT Project # 301-176, Use of Manresa Island as Staging Area for Building Replacement of Metro North RR Walk Bridge over the Norwalk River in Norwalk, Connecticut. According to our information we have records for State Threatened *Falco peregrinus* (Peregrine falcon) and State Special Concern *Malaclemys t. terrapin* (Northern diamondback terrapin) from the vicinity of this project. Thank you for including the protocols you will follow to ensure the protection of the nesting peregrine falcon and northern diamondback terrapin with respect to this project. I concur that by utilizing these protection protocols it will lessen the adverse impact on these two species. I attached the protection plans you have proposed. This determination is good for two years. Please re-submit an NDDB Request for Review if the scope of work changes or if work has not begun on this project by April 16, 2022.

Natural Diversity Data Base information includes all information regarding critical biological resources available to us at the time of the request. PEREGRINE FALCON

Connecticut Threatened Species

Protective Legislation: *Federal* - Migratory Bird Treaty Act of 1918. *State* - Connecticut General Statutes Sec. 26-311.

Scientific Name: *Falco peregrinus*

Size: 15-20 inches (38.1-50.8 cm) in length

Wingspan: 43-46 inches (109.2-116.8 cm)

Habitat Type:

Open country, from coastal lowlands to mountainous high country. High perches in urban areas, bridges and billboards.

Coloration:

- Adult peregrine falcons have long, pointed wings and a long, rounded tail with narrow, black bands, ending with a broad, dark band tipped with white.
- The barred upperparts are blue-gray, while the underparts are white to light buff and cross-barred with brown.
- The black crown and nape extend to the cheeks, forming a distinct black helmet.
- The feet are yellow.
- Immature peregrines are similar, but the back and underparts are brown and the throat is heavily streaked with brown.
- Both adult and immature peregrines have a bold, dark, vertical whisker-like mark (mustache mark) on the sides of the head.

Characteristics:

- Long-winged, medium-sized bird of prey.
- **Call:** A rasping kack-kack-kack. Also a long ascending wail, WEEchew-WEE-chew.
- **Typical Nesting Period:** April through July.
- Nest sites are located above open areas consisting of a hollow, unlined scrape on a cliff, ledge or rocky outcrop. There are falcon nest boxes (top, right photo) located on bridges across Connecticut. Abandoned hawk or raven nests may also be used.
- Pairs may use the same nest site for years

The peregrine falcon is a highly vocal and aggressive bird. Falcons pose a threat to anyone working around the nest area. Falcons will actively defend their nests by swooping and diving at predators. Falcons are capable of plunging from tremendous heights at speeds estimated at over 180 miles per hour. This is their preferred method of hunting. Falcons have sharp talons for grasping and holding prey and should not at anytime be approached or handled. It is required that there be no harassment, intentional or unintentional, to any falcons under state and federal law.

If any peregrine falcons are observed in or around the project area the Office of Environmental Planning (OEP) must be notified at 860-594-2937 or 860-594-2938. If OEP staff cannot be reached at either of the above referenced phone numbers, the District environmental coordinator will need to be contacted to facilitate further coordination with OEP's Water and Noise Compliance Unit.

SECTION 1.10 ENVIRONMENTAL COMPLIANCE

In Article 1.10.03-Water Pollution Control: REQUIRED BEST MANAGEMENT PRACTICES

Add the following after Required Best Management Practices Number 13:

14. The peregrine falcon (*Falco peregrinus*) is a State threatened species and Connecticut's largest falcon, measuring up to 20 inches. Adults are slate gray above and pale underneath with fine bars and spots of black; they have long pointed wings with a narrow tail. Young falcons have the same composition but are darker underneath and browner all over. Peregrine falcons have adapted to life in urban settings. In Connecticut, they sometimes utilize bridges for nesting and brood rearing purposes. Peregrines will actively and aggressively defend the nest. The peregrine will attack anyone or anything that comes within the area of its nest. The peregrine falcon nesting season occurs between the months of April and July. For this reason, special conditions regarding the timing of work on the structures, and immediate area that have nesting falcons must be adhered to.

In order to protect this species and project personnel, any construction and/or inspection activities which are within 400 feet of an identified nest shall not be permitted during nesting season (between April 1st and July 31st.) Any change in construction sequencing or timing affecting work within 400 feet of a known nest shall not be permitted.

The Contractor shall, through the Engineer, at least 10 days prior to the commencement of any construction activities, arrange for a CT DOT Environmental Inspector from the Office of Environmental Planning (OEP) or their authorized delegate to be available to meet and identify the nest location as well as discuss proper protocol for maintaining environmental commitments made to the protection of this species and habitat.

This species is protected by State laws which prohibit killing, harming, taking, or keeping them in your possession. Workers shall be notified of the existence of peregrine falcons in the area and be apprised of the laws protecting them. Photographs of, and the laws protecting, peregrine falcons shall be posted in the Contractor's and DOT field offices (species ID sheets will be provided by OEP). Any observations of this species are to be immediately reported to the Department.

Northern Diamondback Terrapin

Connecticut Species of Special Concern

Scientific Name: *Malaclemys t. terrapin*

Size: Males: 4-5.5 inches (10.2-14 cm) in length

Females: 6-9 inches (15.2-22.9 cm) in length

Habitat Type:

The Northern diamondback terrapin is the only species of turtle in North America, including Connecticut, that spends its life in brackish water (water that is less salty than sea water) which includes salt marshes, estuaries and tidal creeks. They hibernate in the winter submerged in the mud of tidal creeks. If a safety boat or barge is to be used, be cognizant of turtles possibly mating within the project area and proceed slowly when in tidal areas. Nests are constructed on the sandy borders of salt marshes and in dunes.

Colorations:

- The terrapin has both a dark and light variation. Both variations have carapaces (top of shell) patterned with concentric rings or ridges.
 - The dark variant has a completely black carapace (top of shell) with a yellow to off-white plastron (bottom chest plate). Their heads are gray to off-white with small black spots or streaks and their legs are dark gray to black.
 - The lighter variant has a gray to light brown carapace with yellow to greenish gray plastrons. Their heads are gray with small pepper-like gray spots and their legs are gray.
- The plastron may or may not be marked with bold, dark markings.
- The limbs and head may be spotted.
- Hatchlings are patterned similar to adults, but are brighter.

Characteristics:

- Small marine turtle. They spend their entire lives in a brackish environment.
- The carapace is wedge-shaped when viewed from above, with the widest part in the rear.
- They have large webbed feet.

If any Northern diamondback terrapins are observed in or around the project area, the Office of Environmental Planning (OEP) must be notified at 860-594-2937 or 860-594-2938. If OEP staff cannot be reached at either of the above referenced phone numbers, the District Environmental Coordinator will need to be contacted to facilitate further coordination with OEP's Water and Noise Compliance Unit.

SECTION 1.10 - ENVIRONMENTAL COMPLIANCE

In Article 1.10.03-Water Pollution Control: REQUIRED BEST MANAGEMENT PRACTICES

Add the following after Required Best Management Practice Number 13:

14. The Contractor is hereby notified that the State listed species of Special Concern Northern diamondback terrapin (*Malaclemys t. terrapin*), is present within the Project limits. Northern diamondback terrapins are the only species of turtle in North America that spends its life in brackish water (water that is less salty than sea water). They are most abundant in tidal estuaries and will also be found in salt marshes and tidal creeks. Northern diamondback terrapins nest on the sandy borders of these habitats from June to July. Northern diamondback terrapins hibernate during the winter submerged in the mud of tidal creeks. They enter hibernation as early as November and emerge as early as April through the end of May depending on water temperature.

All construction activities taking place within the Project limits will need to be coordinated with the Office of Environmental Planning (OEP) through the Engineer. At least 10 days prior to the commencement of any physical construction activities, the Contractor shall, through the Engineer, arrange for a CTDOT OEP Environmental Inspector, or their authorized delegate, to meet and discuss proper protocol for maintaining environmental commitments made for the protection of this species and habitat. OEP will provide oversight through the Engineer to ensure that the following protocols are followed and maintained during the course of the Project.

During the terrapin's dormant period (November 1 to May 31):

- Once the areas within the Project limits have been inspected and cleared of any nest sites, construction activities will be allowed in upland areas.
- Work is not allowed in wetland/watercourse and sandy border areas unless these areas were in active construction prior to November 1, and additionally, do not contain any areas of terrapin habitat.

For any work done during the terrapin's active period, which includes the nesting and hatching period, (April 1 to October 31), the CTDOT will require the following precautionary measures to protect the terrapin and terrapin habitat:

- a. All construction personnel working within Northern diamondback terrapin habitat must be apprised of the species description and the possible presence of this listed species.
- b. Exclusionary practices will be required in order to prevent any Northern diamondback terrapin access to construction areas. These measures will need to be installed at the limits of disturbance as shown on the plans.

- c. Exclusionary fencing shall be at least 20 inches tall and must be secured to and remain in contact with the ground. The Contractor shall regularly inspect and maintain the fencing to prevent any gaps or openings at ground level. Standard silt fence is adequate; fencing with netting shall not be used.
- d. The Contractor must search the work area each morning for the presence of this listed species prior to any work being done.
- e. Any Northern diamondback terrapins encountered within the immediate work area shall be carefully moved to an adjacent area outside of the excluded area and the Engineer shall be immediately informed to contact OEP with the location.
- f. All staging and storage areas in the vicinity of Northern diamondback terrapin habitat, outside of previously paved locations, regardless of the duration of time they will be used, must be reviewed by and receive written approval from OEP through the Engineer.
- g. No heavy machinery or vehicles may be parked in any identified Northern diamondback terrapin habitat.
- h. Exclusionary fencing shall be removed when it is no longer needed, and silt fence shall be removed as soon as the area is stable, to allow for reptile and amphibian passage to resume.
- i. If a safety boat or barge is required for this Project, the Contractor must use special caution when navigating within tidal creeks. Terrapins tend to congregate close to the surface during their active period. Maintaining slow speeds will ensure the turtles' safety.

These practices will be applied to the entire Project unless a sketch is attached which identifies specific areas of concern.

This species is protected by State laws, which prohibit killing, harming, taking, or keeping them in your possession. Photographs and the laws protecting Northern diamondback terrapin shall be posted in the Contractor's and CTDOT field offices (species ID sheet will be provided by OEP).

Attachment D – Norwalk Shellfish Commission Consultation

Connecticut Department of
Energy & Environmental Protection
Bureau of Water Protection & Land Reuse
Office of Long Island Sound Programs

ATTACHMENT D: SHELLFISH COMMISSION

DEEP PERMIT CONSULTATION FORM

You need to complete and submit this form only if your town has a Shellfish Commission.

To the applicant- Prior to the submission of your permit application to the Connecticut Department of Energy and Environmental Protection- Office of Long Island Sound Programs (DEEP-OLISP), please complete Part I and submit this form to your local shellfish commission (contact the town for the appropriate contact person) with a location map of your site and project plans. Once the commission returns the completed form to you, please submit it along with your permit application to the DEEP.

Part I: To be completed by APPLICANT

1. List applicant information.

Name: **Connecticut Department of Transportation**

Mailing Address: **2800 Berlin Turnpike**

City/Town: **Newington**

Business Phone: **860-594-2931**

Contact Person: **Kimberly C. Lesay**

Email: **Kimberly.Lesay@ct.gov**

State: **CT**

Zip Code: **06131**

ext.

Fax: **860-595-3028**

Title: **Trans. Asst. Planning Director**

2. List engineer/surveyor/agent information.

Name: **HNTB Corporation**

Mailing Address: **55 Capital Boulevard, 4th Floor**

City/Town: **Rocky Hill**

Business Phone: **913-221-3327**

Contact Person: **Christian J. Brown**

Lot

4. Are plans attached? ☐ Yes ☒ No If Yes, provide date of plans:

5. Provide or attach a brief, but thorough description of the project: In cooperation with the Federal Transit Administration (FTA), the Connecticut Department of Transportation (CTDOT) proposes to replace the New Haven Line Railroad Bridge (Walk Bridge, Bridge No. 04288R) crossing the Norwalk River in Norwalk, Connecticut. Walk Bridge, constructed in 1896, is a four-track movable railroad bridge consisting of a 200-foot swing span, supported by a center pivot pier, and two fixed approach spans to the west of the swing span and one fixed approach span to the east of the

swing span. Walk Bridge is a critical piece of public infrastructure on the New Haven Line/Northeast Corridor (NHL/NEC). Walk Bridge carries Amtrak intercity and high-speed passenger service on the NEC, is used for Metro-North Railroad (MNR) commuter rail service, and supports Providence and Worcester Railroad Company (P&W) through freight service. Replacement of the existing Walk Bridge will support Amtrak, MNR and freight service. Additionally, Walk Bridge is the northern boundary of the Norwalk Harbor, rated as a small commercial port by the USACE, with over 2,300 moorings and berthing spaces, and between 2,000 to 3,000 commercial vessel trips per year to port facilities. The replacement bridge will support marine use and operations on the Norwalk River. The purpose of the project is to replace the existing deteriorated bridge with a resilient bridge structure which will enhance the safety and reliability of rail service, offer operational flexibility and ease of maintenance, and provide for increased capacity and efficiencies of rail transportation along the NHL/NEC, while maintaining or improving navigational capacity and dependability for marine traffic in the Norwalk River.

CTDOT proposes to construct a movable vertical lift structure and fixed approach spans to replace the existing movable bridge. The project consists of the removal of the existing bridge, including the superstructure, substructure elements (abutments and piers), timber pier protection system, and deactivated electrical and railroad submarine cables; and construction of the replacement bridge. The four-span replacement bridge includes two side-by-side, 240-foot vertical lift spans across the Norwalk River, each with independently operated mechanical and electrical equipment. The pair of 240-foot vertical lift spans provides a horizontal clearance of approximately 220 feet between the pier-mounted fenders; however, the project does not alter the 170-foot federal navigation channel. The lift spans provide 60.73 feet vertical clearance above mean high water (MHW) when the span is fully raised, and 25.73 feet vertical clearance above MHW when the span is closed.

CTDOT has coordinated with the National Oceanic and Atmospheric Administration/ National Marine Fisheries Service/Greater Atlantic Regional Fisheries Office (NOAA/NMFS/GARFO), CTDEEP Divisions of Wildlife and Fisheries - Marine Fisheries Program, Norwalk Shellfish Commission (NSC), and the U.S. Army Corps of Engineers (USACE) in developing environmental protection measures for the project. Through coordination with NOAA/NMFS/GARFO, CTDEEP, NSC, and USACE, CTDOT has agreed to implement the following environmental protection measures, including time of year restrictions and resource protection measures:

Time of Year Restrictions:

- All pile driving and extraction (including sheet piles) activities conducted between April 1st and June 30th will only occur between one hour after sunrise to one hour before sunset.
- No unconfined turbidity producing activities will be allowed between February 1st and September 30th.
- A soft start will be required between March 16th and October 31st. A soft start will be used at the beginning of each shift that requires pile driving and extraction (including sheet piles) activities, as well as following cessation of activity for a period of 30 minutes or longer. A soft start is defined as follows:
 - a) For impact pile driving: pile driving will commence with an initial set of three strikes by the hammer at 40% energy, followed by a one-minute wait period, then two subsequent three-strike sets at 40% energy, with one-minute waiting periods, before initiating continuous impact driving.
 - b) For vibratory pile installation: pile driving will be initiated for 15 seconds at reduced energy followed by a one-minute waiting period. This sequence of 15 seconds of reduced energy driving, one-minute waiting period will be repeated two additional times, followed immediately by pile-driving at full rate and energy.
- Unconfined dredging will be conducted within turbidity curtains between December 1st and January 31st.
- Dredging from February 1st through November 30th will be conducted within a marine enclosure

enclosed by a turbidity curtain.

- No construction and/or inspection activities which are within 400 feet of an identified peregrine falcon (*Falco peregrinus*) nest will be permitted during nesting season, between April 1st and July 31st.
- Use of the Manresa Island Staging and Storage Yard will be started before April 15th or after August 1st to allow for the nesting ospreys (*Pandion haliaetus*), to acclimate to this new activity within their nesting areas.
- Slow speeds along all access roads at Manresa Island will be enforced during the Northern diamondback terrapin (*Malaclemys t. terrapin*), active season from April 1st through October 31st.

Resource Protection Measures:

- Pile driving/extraction and drilled shaft and micropile drilling activities will be coordinated to ensure that the navigation channel is available for marine traffic and fish passage; activities will occupy less than 50% when working in the middle of the navigation channel.
- Barge movements will take place such that there will be no impact to the river bottom.
- Marine enclosures will be installed prior to the start of certain construction activities. Marine enclosures are steel sheet pile structures that are not to be considered as being watertight. The sheeting allows low velocity flow between the enclosure and the outer tidal waters; the elevation of water inside the enclosure is isolated from tidal waters and therefore lags the tide. The marine enclosure will be installed so that the top of the enclosure is at, or above, Elevation 6.2 (NAVD88), 1 foot above the high tide line. The marine enclosure will be protected from navigation impacts with a temporary fender system consisting of mooring piles and temporary floating fenders between the mooring piles. To further prevent siltation outside of the marine enclosure, a turbidity curtain will be deployed around its exterior perimeter.
- All pile driving and extraction (including sheet piles) activity will be enclosed within turbidity curtains.
- Type III Department of Transportation (DOT) heavyweight turbidity control curtains will be used. If needed, pin piles will be used to hold the turbidity curtains in place. Turbidity curtains will be installed prior to the start of the following activities:
 - Marine enclosure installation,
 - Pier construction (with marine enclosure),
 - Pier removal (with marine enclosure),
 - Existing submarine cable removal,
 - Slide rail installation and removal for swing span removal,
 - Control house independent fender system installation and existing fender removal,
 - Navigational/maintenance dredging,
 - Construction platform pile driving,
 - Pile installation and removal at the temporary vessel dock relocation site,
 - New dredging (with marine enclosure if outside the dredging work window) at the temporary vessel dock relocation site [waterward of 68 and 90 Water Street (Parcels 2/84/19 and 2/84/33)] and at the permanent vessel dock location site [waterward of 4 North Water Street (Parcel 2/19/1)],

- Bulkhead installation at 68 and 90 Water Street (Parcels 2/84/19 and 2/84/33),
- Sheet pile installation and outfall reconstruction at the IMAX,
- IMAX Theater removal (with marine enclosure),
- Wetland restoration.
- The marine enclosures and turbidity curtains will be installed and maintained by the contractor. Prior to removal of the marine enclosure following each activity, the water inside the marine enclosure will be monitored for total suspended solids. Once the turbidity readings reach equilibrium with those readings outside of the turbidity curtain, then the marine enclosure can be removed. The turbidity curtains will remain in place until that portion of the project is complete and the turbidity has settled to no more than pre-construction conditions.
- Water quality monitoring for turbidity, specific conductivity, salinity, dissolved oxygen, pH, temperature and water level (at one location) will be conducted during the duration of in-water construction activities.

Part II: To be completed by SHELLFISH COMMISSION

This consultation form is required to be submitted as part of an application for a Structures, Dredging & Fill permit (section 22a-361 of the Connecticut General Statutes (CGS)) and/or Tidal Wetlands permit (CGS section 22a-32) to the DEEP-OLISP. The application has not yet been submitted to the DEEP. Please review the enclosed materials and determine whether the project will adversely impact shellfish beds. You may also provide comments or recommendations regarding the proposal. Should you have any questions regarding this process, please call DEEP-OLISP at (860) 424-3034 to speak with the analyst assigned to the town in which the work is proposed.

Please return the completed form to the applicant.

SHELLFISH COMMISSION DETERMINATION:

Project located on (check one): ☐ natural bed ☐ state bed ☐ local bed ☐ none
☐ other, please specify:

If project is located upon a franchised or leased shellfish bed, please provide the owner or lessee's contact information below.

Check one of the following:

- ☐ I have determined that the work described in Part I of this form and attachments **WILL NOT** adversely impact a shellfish area.
- ☐ I have determined that the work described in Part I of this form and attachments **WILL** adversely impact a shellfish area. A summary of the Shellfish Commission's project-specific concerns/comments is described below or attached.

COMMENTS/RECOMMENDATIONS (check the box if attached: ☐):

Chronology of Norwalk Shellfish Commission Consultation

Below is a list of meetings and consultations in which CTDOT participated with the Norwalk Shellfish Commission on the Walk Bridge Replacement Project in preparation for the Structures, Dredging and Fill and Section 401 permit application filing. Prior to the Commission meetings, CTDOT forwarded draft permitting plates and application components (including specifications) to the Commission for review and discussion. The purposes of the meetings were to review the construction activities and discuss and resolve concerns of the Commission.

Date	Activity	Purpose
6/7/2018	Shellfish Commission Meeting	Presentation of proposed Tet Pile Program and removal of piles from former marina; discussion of CP-243 submarine cable commitments.
11/1/2018	Shellfish Commission Meeting	Presented the NMFS/GARFO section 7/EFH submission.
1/3/2019	Shellfish Commission Meeting	Discussion and review of permit application sections (including plates).
2/7/2019	Shellfish Commission Meeting	Discussion and review of permit application sections (including plates).
3/7/2019	Shellfish Commission Meeting	Presentation of Tidal Restoration. Discussion and review of permit application sections (including plates).
6/6/2019	Shellfish Commission Meeting	Discussion and review of permit application, with focus on turbidity monitoring and sediment dewatering; wetland mitigation, barge mooring.
6/26/2019	Submittal of Structures Dredge and Fill Permitting Consultation Form	Review of wetland mitigation plans.
7/11/2019	Shellfish Commission Meeting	Discussion of responses to Commission's questions on wetland mitigation and turbidity.
8/1/2019	Shellfish Commission Meeting	
4/22/2020	Meeting with Shellfish Commission and Harbor Management Commission	Discussion of vessel relocation plans.
6/15/2020	Submittal of Structures Dredge and Fill Permitting Revised Consultation Form	
9/3/2020	Shellfish Commission Meeting	Overview of status of project and review of questions presented by the two Commissions at the 6/16/20 Manresa Island public meeting, including water quality information.
2/4/2021	Shellfish Commission Meeting	Update of project and discussion of vessel and safety testing for revised vessel relocation plans to include two sites.

4. Are plans attached? ☐ Yes ☒ No If Yes, provide date of plans:

5. Provide or attach a brief, but thorough description of the project: In cooperation with the Federal Transit Administration (FTA), the Connecticut Department of Transportation (CTDOT) proposes to replace the New Haven Line Railroad Bridge (Walk Bridge, Bridge No. 04288R) crossing the Norwalk River in Norwalk, Connecticut. Walk Bridge, constructed in 1896, is a four-track movable railroad bridge consisting of a 200-foot swing span, supported by a center pivot pier, and two fixed approach spans to the west of the swing span and one fixed approach span to the east of the swing span. Walk Bridge is a critical piece of public infrastructure on the New Haven

Line/Northeast Corridor (NHL/NEC). Walk Bridge carries Amtrak intercity and high-speed passenger service on the NEC, is used for Metro-North Railroad (MNR) commuter rail service, and supports Providence and Worcester Railroad Company (P&W) through freight service. Replacement of the existing Walk Bridge will support Amtrak, MNR and freight service. Additionally, Walk Bridge is the northern boundary of the Norwalk Harbor, rated as a small commercial port by the USACE, with over 2,300 moorings and berthing spaces, and between 2,000 to 3,000 commercial vessel trips per year to port facilities. The replacement bridge will support marine use and operations on the Norwalk River. The purpose of the project is to replace the existing deteriorated bridge with a resilient bridge structure which will enhance the safety and reliability of rail service, offer operational flexibility and ease of maintenance, and provide for increased capacity and efficiencies of rail transportation along the New Haven Line/Northeast Corridor, while maintaining or improving navigational capacity and dependability for marine traffic in the Norwalk River.

CTDOT proposes to construct a movable vertical lift structure and fixed approach spans to replace the existing movable bridge. The project consists of the removal of the existing bridge, including the superstructure, substructure elements (abutments and piers), timber pier protection system, and deactivated electrical and railroad submarine cables; and construction of the replacement bridge. The four-span replacement bridge includes two side-by-side, 240-foot vertical lift spans across the Norwalk River, each with independently operated mechanical and electrical equipment. The pair of 240-foot vertical lift spans provides a horizontal clearance of approximately 220 feet between the pier-mounted fenders; however, the project does not alter the 170-foot federal navigation channel. The lift spans provide 60.73 feet vertical clearance above mean high water (MHW) when the span is fully raised, and 25.73 feet vertical clearance above MHW when the span is closed.

CTDOT has coordinated with the National Oceanic and Atmospheric Administration/ National Marine Fisheries Service/Greater Atlantic Regional Fisheries Office (NOAA/NMFS/GARFO), CTDEEP Divisions of Wildlife and Fisheries - Marine Fisheries Program, the Norwalk Shellfish Commission (NSC), and the U.S. Army Corps of Engineers (USACE) in developing environmental protection measures for the project. Through coordination with NOAA/NMFS/GARFO, CTDEEP, NSC, and USACE, CTDOT has agreed to implement the following environmental protection measures, including time of year restrictions and resource protection measures:

Time of Year Restrictions:

- All pile driving and extraction (including sheet piles) activities conducted between April 1st and June 30th will only occur between one hour after sunrise to one hour before sunset.
- No unconfined turbidity producing activities will be allowed between February 1st and September 30th.
- A soft start will be required between March 16th and October 31st. A soft start will be used at the beginning of each shift that requires pile driving and extraction (including sheet piles) activities, as well as following cessation of activity for a period of 30 minutes or longer. A soft start is defined as follows:
 - a) For impact pile driving: pile driving will commence with an initial set of three strikes by the hammer at 40% energy, followed by a one-minute wait period, then two subsequent three-strike sets at 40% energy, with one-minute waiting periods, before initiating continuous impact driving.
 - b) For vibratory pile installation: pile driving will be initiated for 15 seconds at reduced energy followed by a one-minute waiting period. This sequence of 15 seconds of reduced energy driving, one-minute waiting period will be repeated two additional times, followed immediately by pile-driving at full rate and energy.
- Unconfined dredging will be conducted within turbidity curtains between December 1st and January 31st.
- Dredging from February 1st through November 30th will be conducted within a marine enclosure

enclosed by a turbidity curtain.

- No construction and/or inspection activities which are within 400 feet of an identified peregrine falcon (*Falco peregrinus*) nest will be permitted during nesting season, between April 1st and July 31st.
- Use of the Manresa Island Staging and Storage Yard will be started before April 15th or after August 1st to allow for the nesting ospreys (*Pandion haliaetus*), to acclimate to this new activity within their nesting areas.
- Slow speeds along all access roads at Manresa Island will be enforced during the Northern diamondback terrapin (*Malaclemys t. terrapin*), active season from April 1st through October 31st.

Resource Protection Measures:

- Pile driving/extraction and drilled shaft and micropile drilling activities will be coordinated to ensure that the navigation channel is available for marine traffic and fish passage; activities will occupy less than 50% when working in the middle of the navigation channel.
- Barge movements will take place such that there will be no impact to the river bottom.
- Marine enclosures will be installed prior to the start of certain construction activities. Marine enclosures are steel sheet pile structures that are not to be considered as being watertight. The sheeting allows low velocity flow between the enclosure and the outer tidal waters; the elevation of water inside the enclosure is isolated from tidal waters and therefore lags the tide. The marine enclosure will be installed so that the top of the enclosure is at, or above, Elevation 6.2 (NAVD88), 1 foot above the high tide line. The marine enclosure will be protected from navigation impacts with a temporary fender system consisting of mooring piles and temporary floating fenders between the mooring piles. To further prevent siltation outside of the marine enclosure, a turbidity curtain will be deployed around its exterior perimeter.
- All pile driving and extraction (including sheet piles) activity will be enclosed within turbidity curtains.
- Type III Department of Transportation (DOT) heavyweight turbidity control curtains will be used. If needed, pin piles will be used to hold the turbidity curtains in place. Turbidity curtains will be installed prior to the start of the following activities:
 - Marine enclosure installation,
 - Pier construction (with marine enclosure),
 - Pier removal (with marine enclosure),
 - Existing submarine cable removal,
 - Slide rail installation and removal for swing span removal,
 - Control house independent fender system installation and existing fender removal,
 - Navigational/maintenance dredging,
 - Construction platform pile driving,
 - Pile installation and removal at the temporary vessel dock relocation site,
 - New dredging (with marine enclosure if outside the dredging work window) at the temporary vessel dock relocation site [waterward of 68 and 90 Water Street (Parcels 2/84/19 and 2/84/33)] and at the permanent vessel dock location site [waterward of 4 North Water Street (Parcel 2/19/1)],

- Bulkhead installation at 68 and 90 Water Street (Parcels 2/84/19 and 2/84/33),
- Sheet pile installation and outfall reconstruction at the IMAX,
- IMAX Theater removal (with marine enclosure),
- Wetland restoration.
- The marine enclosures and turbidity curtains will be installed and maintained by the contractor. Prior to removal of the marine enclosure following each activity, the water inside the marine enclosure will be monitored for total suspended solids. Once the turbidity readings reach equilibrium with those readings outside of the turbidity curtain, then the marine enclosure can be removed. The turbidity curtains will remain in place until that portion of the project is complete and the turbidity has settled to no more than pre-construction conditions.
- Water quality monitoring for turbidity, specific conductivity, salinity, dissolved oxygen, pH, temperature and water level (at one location) will be conducted during the duration of in-water construction activities.

Part II: To be completed by HARBOR MANAGEMENT COMMISSION

This consultation form is required to be submitted as part of an application for a Structures, Dredging & Fill permit (section 22a-361 of the Connecticut General Statutes (CGS)) and/or Tidal Wetlands permit (CGS section 22a-32) to the DEEP- OLISP. The application has not yet been submitted to the DEEP. Please review the enclosed materials and determine whether the project is consistent or inconsistent with your local Harbor Management Plan. You may also provide comments or recommendations regarding the proposal. The Harbor Management Commission may still provide written comments to the Commissioner during the Department's public notice comment period. Should you have any questions regarding this process, please call DEEP-OLISP at (860) 424-3034 to speak with the analyst assigned to the town in which the work is proposed. **Please return the completed form to the applicant.**

HARBOR MANAGEMENT COMMISSION DETERMINATION:

Check one of the following:

- ☐ The Commission has determined that the work as described in Part I of this form and attachments is **CONSISTENT** with the harbor management plan.
- ☐ The Commission has determined that the work as described in Part I of this form and attachments is **INCONSISTENT** with the following section of the harbor management plan:

Chronology of Norwalk Harbor Management Commission Consultation

Below is a list of meetings and consultations, in which CTDOT participated with the Norwalk Harbor Management Commission on the Walk Bridge Replacement Project in preparation for the Structures, Dredging and Fill and Section 401 permit application filing. Prior to the Commission meetings, CTDOT forwarded draft permitting plates and application components (including specifications) to the Commission for review and discussion. The purposes of the meetings were to review the construction activities and discuss and resolve concerns of the Commission.

Date	Activity	Purpose
5/23/2018	Harbor Management Commission Meeting	Presentation of Test Pile Program and overview of water-related activities for the project.
2/27/2019	Harbor Management Commission Meeting	Pre-permit application consultation: project update, permit plate updates, with focus on water quality monitoring, wetland mitigation, and dredging.
3/27/2019	Harbor Management Commission Meeting	Pre-permit application consultation: project update, permit plate updates, with focus on HDD.
5/22/2019	Harbor Management Commission Meeting	Pre-permit application consultation: project update, permit plate updates, including ductbank, bulkhead, vessel relocation.
6/26/2019	Submittal of Structures Dredge and Fill Permitting Consultation Form	
9/25/2019	Harbor Management Commission Meeting	Discussion of safety test conducted for vessel relocation.
4/22/2020	CTDOT meeting with Harbor Management Commission and Shellfish Commission	Discussion of vessel dock relocation plan.
5/8/2020	CTDOT Meeting with Harbor Management Commission and Harbor Master	Discussion of Navigation Safety Risk Assessment, contractor operations, and risk mitigation.
6/15/2020	Submittal of Structures Dredge and Fill Permitting Revised Consultation Form	
8/26/2020	Harbor Management Commission Meeting	Discussion of construction activities, including vessel relocation, Manresa Island construction staging.
1/27/2021	Harbor Management Commission Meeting	Update of project, including presentation of revised construction vessel mooring and vessel relocation plans to include two sites.

Chronology of Norwalk Harbor Management Commission Correspondence

Below is a list of correspondence among CTDOT, the Norwalk Harbor Management Commission (NHMC), and Norwalk Harbor Master on the Walk Bridge Replacement Project in preparation for the Structures, Dredging and Fill and Section 401 permit application filing.

Date	Correspondence	Subject
2/27/2019	Issue Paper, NHMC to CTDOT Office of Environmental Protection (OEP)	Outline of Pre-Application Review Issues and Recommendations
7/18/2019	Memorandum, CTDOT to NHMC	Responses to Pre-application Issues and Recommendations
1/28/2020	Letter, NHMC to Connecticut Department of Energy and Environmental Protection (CTDEEP)	Vessel Relocation Plans for the Walk Bridge Project
1/26/2021	Letter, Norwalk Harbor Master to CTDEEP	CT DOT Vessel Relocation Plans for the Walk Bridge Project
1/26/2021	Letter, NHMC to CTDEEP	Vessel Relocation Plans for the Walk Bridge Project
March 2021	Letter, CTDOT to CTDEEP	Response to CTDEEP regarding NHMC's comments on the vessel relocation plans for the Walk Bridge Project
March 2021	Letter, CTDOT to CTDEEP	Response to CTDEEP regarding the Norwalk Harbor Master's comments on the vessel relocation plans for the Walk Bridge Project

DEEP PERMIT CONSULTATION FORM

You need to complete and submit this form only if the subject site is located along the coastal area or in the municipalities as follows: south of Lyme or Essex on the Connecticut River; south of Orange and Derby/Ansonia on the Housatonic River; south of Norwich and Preston on the Thames River; or Lyme, Essex, Orange, Derby/Ansonia, Norwich or Preston and the activity includes dredging.

To the applicant- Prior to the submission of your permit application to the Connecticut Department of Energy and Environmental Protection- Office of Long Island Sound Programs (DEEP-OLISP), please complete Part I and submit this form to the Department of Agriculture, Bureau of Aquaculture ("DOA/BOA") (P.O. Box 97, Milford, CT 06460 or by facsimile at 203-783-9976) with a location map of your site and project plans. Once the DOA/BOA returns the completed form to you, please submit it along with your permit application to the DEEP.

Part I: To be completed by APPLICANT

1. List applicant information.

Name: **Connecticut Department of Transportation**
Mailing Address: **2800 Berlin Turnpike**
City/Town: **Newington** State: **CT** Zip Code: **06131**
Business Phone: **860-594-2931** ext. Fax: **860-595-3028**
Contact Person: **Kimberly C. Lesay** Title: **Trans. Asst. Planning Director**
E-mail: **Kimberly.Lesay@ct.gov**

2. List engineer/surveyor/agent information.

Name: **HNTB Corporation**
Mailing Address: **55 Capital Boulevard, 4th Floor**
City/Town: **Rocky Hill** State: **CT** Zip Code: **06067**
Business Phone: **913-221-3327** ext. Fax: **860-257-7394**
Contact Person: **Christian J. Brown** Title: **Project Manager**
E-mail: **cbrown@hntb.com**
Service Provided: **Design and Permitting**

3. Site Location:

Street Address or Location Description: **Walk Bridge - RR Bridge Over the Norwalk River**
City/Town: **Norwalk** State: **CT** Zip Code: **06855**
Tax Assessor's Reference: Map Block Lot

4. Are plans attached? ☐ Yes ☒ No If Yes, provide date of plans:

Part I: To be completed by APPLICANT (continued)

5. Provide or attach a brief, but thorough description of the project. In cooperation with the Federal Transit Administration (FTA), the Connecticut Department of Transportation (CTDOT) proposes to replace the New Haven Line Railroad Bridge (Walk Bridge, Bridge No. 04288R) crossing the Norwalk River in Norwalk, Connecticut. Walk Bridge, constructed in 1896, is a four-track movable railroad bridge consisting of a 200-foot swing span, supported by a center pivot pier, and two fixed approach spans to the west of the swing span and one fixed approach span to the east of the swing span. Walk Bridge is a critical piece of public infrastructure on the New Haven Line/Northeast Corridor (NHL/NEC). Walk Bridge carries Amtrak intercity and high-speed passenger service on the NEC, is used for Metro-North Railroad (MNR) commuter rail service, and supports Providence and Worcester Railroad Company (P&W) through freight service. Replacement of the existing Walk Bridge will support Amtrak, MNR and freight service. Additionally, Walk Bridge is the northern boundary of the Norwalk Harbor, rated as a small commercial port by the USACE, with over 2,300 moorings and berthing spaces, and between 2,000 to 3,000 commercial vessel trips per year to port facilities. The replacement bridge will support marine use and operations on the Norwalk River. The purpose of the project is to replace the existing deteriorated bridge with a resilient bridge structure which will enhance the safety and reliability of rail service, offer operational flexibility and ease of maintenance, and provide for increased capacity and efficiencies of rail transportation along the New Haven Line/Northeast Corridor, while maintaining or improving navigational capacity and dependability for marine traffic in the Norwalk River.

CTDOT proposes to construct a movable vertical lift structure and fixed approach spans to replace the existing movable bridge. The project consists of the removal of the existing bridge, including the superstructure, substructure elements (abutments and piers), timber pier protection system, and deactivated electrical and railroad submarine cables; and construction of the replacement bridge. The four-span replacement bridge includes two side-by-side, 240-foot vertical lift spans across the Norwalk River, each with independently operated mechanical and electrical equipment. The pair of 240-foot vertical lift spans provides a horizontal clearance of 220 feet between the pier-mounted fenders; however, the project does not alter the 170-foot federal navigation channel. The lift spans provide 60.73 feet vertical clearance above mean high water (MHW) when the span is fully raised, and 25.73 feet vertical clearance above MHW when the span is closed.

CTDOT has coordinated with the National Oceanic and Atmospheric Administration/ National Marine Fisheries Service/Greater Atlantic Regional Fisheries Office (NOAA/NMFS/GARFO), CTDEEP Divisions of Wildlife and Fisheries - Marine Fisheries Program, the Norwalk Shellfish Commission (NSC), and the U.S. Army Corps of Engineers (USACE) in developing environmental protection measures for the project. Through coordination with NOAA/NMFS/GARFO, CTDEEP, NSC, and USACE, CTDOT has agreed to implement the following environmental protection measures, including time of year restrictions and resource protection measures:

Time of Year Restrictions:

- All pile driving and extraction (including sheet piles) activities conducted between April 1st and June 30th will only occur between one hour after sunrise to one hour before sunset.
- No unconfined turbidity producing activities will be allowed between February 1st and September 30th.
- A soft start will be required between March 16th and October 31st. A soft start will be used at the beginning of each shift that requires pile driving and extraction (including sheet piles) activities, as well as following cessation of activity for a period of 30 minutes or longer. A soft start is defined as follows:
 - a) For impact pile driving: pile driving will commence with an initial set of three strikes by the hammer at 40% energy, followed by a one-minute wait period, then two subsequent three-strike sets at 40% energy, with one-minute waiting periods, before initiating continuous impact driving.
 - b) For vibratory pile installation: pile driving will be initiated for 15 seconds at reduced energy

followed by a one-minute waiting period. This sequence of 15 seconds of reduced energy driving, one-minute waiting period will be repeated two additional times, followed immediately by pile-driving at full rate and energy.

- Unconfined dredging will be conducted within turbidity curtains between December 1st and January 31st.
- Dredging from February 1st through November 30th will be conducted within a marine enclosure enclosed by a turbidity curtain.
- No construction and/or inspection activities which are within 400 feet of an identified peregrine falcon (*Falco peregrinus*) nest will be permitted during nesting season, between April 1st and July 31st.
- Use of the Manresa Island Staging and Storage Yard will be started before April 15th or after August 1st to allow for the nesting ospreys (*Pandion haliaetus*), to acclimate to this new activity within their nesting areas.
- Slow speeds along all access roads at Manresa Island will be enforced during the Northern diamondback terrapin (*Malaclemys t. terrapin*), active season from April 1st through October 31st.

Resource Protection Measures:

- Pile driving/extraction and drilled shaft and micropile drilling activities will be coordinated to ensure that the navigation channel is available for marine traffic and fish passage; activities will occupy less than 50% when working in the middle of the navigation channel.
- Barge movements will take place such that there will be no impact to the river bottom.
- Marine enclosures will be installed prior to the start of certain construction activities. Marine enclosures are steel sheet pile structures that are not to be considered as being watertight. The sheeting allows low velocity flow between the enclosure and the outer tidal waters; the elevation of water inside the enclosure is isolated from tidal waters and therefore lags the tide. The marine enclosure will be installed so that the top of the enclosure is at, or above, Elevation 6.2 (NAVD88), 1 foot above the high tide line. The marine enclosure will be protected from navigation impacts with a temporary fender system consisting of mooring piles and temporary floating fenders between the mooring piles. To further prevent siltation outside of the marine enclosure, a turbidity curtain will be deployed around its exterior perimeter.
- All pile driving and extraction (including sheet piles) activity will be enclosed within turbidity curtains.
- Type III Department of Transportation (DOT) heavyweight turbidity control curtains will be used. If needed, pin piles will be used to hold the turbidity curtains in place. Turbidity curtains will be installed prior to the start of the following activities:
 - Marine enclosure installation,
 - Pier construction (with marine enclosure),
 - Pier removal (with marine enclosure),
 - Existing submarine cable removal,
 - Slide rail installation and removal for swing span removal,
 - Control house independent fender system installation and existing fender removal,
 - Navigational/maintenance dredging,

- Construction platform pile driving,
 - Pile installation and removal at the temporary vessel dock relocation site,
 - New dredging (with marine enclosure if outside the dredging work window) at the temporary vessel dock relocation site [waterward of 68 and 90 Water Street (Parcels 2/84/19 and 2/84/33)] and at the permanent vessel dock location site [waterward of 4 North Water Street (Parcel 2/19/1)],
 - Bulkhead installation at 68 and 90 Water Street (Parcels 2/84/19 and 2/84/33),
 - Sheet pile installation and outfall reconstruction at the IMAX,
 - IMAX Theater removal (with marine enclosure),
 - Wetland restoration.
- The marine enclosures and turbidity curtains will be installed and maintained by the contractor. Prior to removal of the marine enclosure following each activity, the water inside the marine enclosure will be monitored for total suspended solids. Once the turbidity readings reach equilibrium with those readings outside of the turbidity curtain, then the marine enclosure can be removed. The turbidity curtains will remain in place until that portion of the project is complete and the turbidity has settled to no more than pre-construction conditions.
 - Water quality monitoring for turbidity, specific conductivity, salinity, dissolved oxygen, pH, temperature and water level (at one location) will be conducted during the duration of in-water construction activities.

Part II: To be completed by DEPARTMENT OF AGRICULTURE / BUREAU OF AQUACULTURE

This consultation form is required to be submitted as part of an application for a Structures, Dredging & Fill permit (section 22a-361 of the Connecticut General Statutes (CGS)) and/or Tidal Wetlands permit (CGS section 22a-32) to the DEEP- OLISP. The application has not yet been submitted to the DEEP. Please review the enclosed materials and determine whether the project will significantly impact shellfish beds. You may also provide comments or recommendations regarding the proposal. Should you have any questions regarding this process, please call DEEP-OLISP at (860) 424-3034 to speak with the analyst assigned to the town in which the work is proposed. **Please return the completed form to the applicant.**

Section 22a-361(b) of the Connecticut General Statutes requires that the Commissioner of the DEEP shall hold a public hearing on permit applications submitted pursuant to CGS section 22a-361 provided that a petition requesting such hearing signed by 25 or more persons is received **and** if the project will significantly impact any shellfish area, as determined by the Director of the Bureau of Aquaculture at the Department of Agriculture.

DEPARTMENT OF AGRICULTURE/ BUREAU OF AQUACULTURE DETERMINATION:

Project located on (check one): ☐ natural bed ☐ state bed ☐ local bed ☒ none
☐ other, please specify:

If project is located upon a franchised or leased shellfish bed, please provide the owner or lessee's contact information below.

Check one of the following:

- ☒ I have determined that the work described in Part I of this form and attachments **WILL NOT** significantly impact any shellfish area.
- ☐ I have determined that the work described in Part I of this form and attachments **WILL** significantly impact any shellfish area and that a public hearing must be held if the DEEP issues a public notice for the project as currently designed and a qualified petition is received.

COMMENTS/RECOMMENDATIONS (or check here if attached: ☐):

The addition of the staging area at Manresa lessens the impact by eliminating the temporary anchoring of work barges on shellfish areas.

David H. Carey

Attachment N – U.S. Army Corps of Engineers Consultation

**Connecticut Department of
Energy & Environmental Protection**
Bureau of Water Protection & Land Reuse
Office of Long Island Sound Programs

ATTACHMENT N: U.S. ARMY CORPS OF ENGINEERS DEEP PERMIT CONSULTATION FORM

To the applicant- Prior to the submission of your permit application to the Connecticut Department of Energy and Environmental Protection - Office of Long Island Sound Programs (DEEP- OLISP), please complete Part I and submit this form to the U.S. Army Corps of Engineers (USACE), Regulatory Division, Attn: Diane M. Ray, 696 Virginia Road, Concord, MA 01742, with a location map of your site and project plans. Once they return the completed form to you, please submit it along with your permit application to the DEEP.

Part I: Applicant Information

To be completed by applicant.

1. List applicant information:

Name: Connecticut Department of Transportation
Mailing Address: 2800 Berlin Turnpike
City/Town: Newington State: CT Zip Code: 06131
Business Phone: 860-594-2931 ext. _____ Fax: 860-595-3028
Contact Person: Kimberly C. Lesay Title: Trans. Asst. Planning Director
E-mail: Kimberly.Lesay@ct.gov

2. List engineer, surveyor or agent information:

Name: HNTB Corporation
Mailing Address: 55 Capital Boulevard, 4th Floor
City/Town: Rocky Hill State: CT Zip Code: 06067
Business Phone: 913-221-3327 ext. _____ Fax: 860-257-7394
Contact Person: Christian J. Brown Title: Project Manager
E-mail: cbrown@hntb.com
Service provided: Design and Permitting

3. Site location:

Name of site : Walk Bridge
Street Address or Location Description: Walk Bridge - RR Bridge Over the Norwalk River
City/Town: Norwalk State: CT Zip Code: 06855
Tax Assessor's Reference: Map _____ Block _____ Lot _____

4. Are plans attached? ☐ Yes ☒ No If yes, provide date of plans: _____

Part I: Applicant Information (continued)

5. Provide or attach a brief, but thorough description of the project:

In cooperation with the Federal Transit Administration (FTA), the Connecticut Department of Transportation (CTDOT) proposes to replace the New Haven Line Railroad Bridge (Walk Bridge, Bridge No. 04288R) crossing the Norwalk River in Norwalk, Connecticut. Walk Bridge, constructed in 1896, is a four-track movable railroad bridge consisting of a 200-foot swing span, supported by a center pivot pier, and two fixed approach spans to the west of the swing span and one fixed approach span to the east of the swing span. Walk Bridge is a critical piece of public infrastructure on the New Haven Line/Northeast Corridor (NHL/NEC). Walk Bridge carries Amtrak intercity and high-speed passenger service on the NEC, is used for Metro-North Railroad (MNR) commuter rail service, and supports Providence and Worcester Railroad Company (P&W) through freight service. Replacement of the existing Walk Bridge will support Amtrak, MNR and freight service. Additionally, Walk Bridge is the northern boundary of the Norwalk Harbor, rated as a small commercial port by the USACE, with over 2,300 moorings and berthing spaces, and between 2,000 to 3,000 commercial vessel trips per year to port facilities. The replacement bridge will support marine use and operations on the Norwalk River. The purpose of the project is to replace the existing deteriorated bridge with a resilient bridge structure which will enhance the safety and reliability of rail service, offer operational flexibility and ease of maintenance, and provide for increased capacity and efficiencies of rail transportation along the New Haven Line/Northeast Corridor, while maintaining or improving navigational capacity and dependability for marine traffic in the Norwalk River.

CTDOT proposes to construct a movable vertical lift structure and fixed approach spans to replace the existing movable bridge. The project consists of the removal of the existing bridge, including the superstructure, substructure elements (abutments and piers), timber pier protection system, and deactivated electrical and railroad submarine cables; and construction of the replacement bridge. The four-span replacement bridge includes two side-by-side, 240-foot vertical lift spans across the Norwalk River, each with independently operated mechanical and electrical equipment. The pair of 240-foot vertical lift spans provides 170 feet horizontal navigational clearance between fenders, 60.73 feet vertical clearance above mean high water (MHW) when the span is fully raised, and 25.73 feet vertical clearance above MHW when the span is closed.

CTDOT has coordinated with the National Oceanic and Atmospheric Administration/ National Marine Fisheries Service (NOAA/NMFS), CTDEEP, and the U.S. Army Corps of Engineers (USACE) in developing environmental protection measures for the project. Through coordination with NOAA/NMFS, CTDEEP, and USACE, CTDOT has agreed to implement the following environmental protection measures, including time of year restrictions and resource protection measures:

Time of Year Restrictions:

- Dredging will occur only between December 1st and January 31st;
- Unconfined in-water silt producing activities will occur only between October 1st and January 31st (excluding installation and removal of piles and sheetpiles);
- Pile driving between April 1st and June 30th will occur only during predetermined daily time windows as follows: 12-hour work periods followed by 12-hour work-free periods;
- Pile driving between March 16th and October 31st will use soft starts at the beginning of each shift (piles installed between November 1st and March 15th do not need to use soft starts).

Resource Protection Measures:

- Pile driving/extraction and drilled shaft and micropile drilling activities will be coordinated to ensure activities are only taking place on one half (or occupy only 50% when working in the middle of the river) of the navigation channel at a time.
- Marine enclosures will be installed prior to the start of certain construction activities. Marine enclosures are steel sheet pile structures that are not to be considered as being water-tight. The sheeting allows low velocity flow between the enclosure and the outer tidal waters; the elevation of water inside the enclosure is isolated from tidal waters and therefore lags the tide. The marine enclosures will be installed so that the top of the enclosure is at, or above, Elevation 6.2 (1 foot above the high tide line). To further prevent siltation outside of the marine enclosure, a turbidity curtain will be deployed around its exterior perimeter. The turbidity curtain will be held stationary using anchors, barges, or existing piles.
- Turbidity curtains [Type 3 Department of Transportation (DOT) Heavy Duty Tidal Waters] will be installed prior to the start of the following activities:
 - o Marine enclosure installation,

- o Pier construction (with marine enclosure),
- o Pier removal (with marine enclosure),
- o Duct bank and submarine cable installation (with marine enclosure),
- o Existing submarine cable removal,
- o Slide rail installation and removal for swing span removal,
- o Fender pile installation and existing fender removal,
- o Dredging,
- o Construction platform pile driving,
- o Pile installation and removal at the vessel docks,
- o Bulkhead installation and removal (with marine enclosure) at Marine Staging Yard,
- o Sheet pile installation and outfall reconstruction at the IMAX,
- o IMAX Theater removal (with marine enclosure),
- o Wetland restoration.
- Water quality monitoring for turbidity and contaminants will be conducted during in-water construction activities.

Part II: To be Completed by US Army Corps of Engineers

This consultation form is required to be submitted as part of an application for a Structures, Dredging & Fill permit (section 22a-361 of the Connecticut general Statutes (CGS)) and/or Tidal Wetlands permit (CGS section 22a-32) to the DEEP- OLISP. The application has not yet been submitted to the DEEP. Please review the enclosed materials with regard to the U.S. Army Corp of Engineers review process pursuant to Section 10 of the Rivers and Harbors Act of 1899 and Section 404 of the Clean Water Act; and provide any comments or recommendations you may have with regard to this proposal. Please call DEEP-OLISP at 860-424-3034 to speak with the analyst assigned to the town in which the work is proposed if you have any questions. **Please return the completed form to the applicant.**

Chronology of U.S. Army Corps of Engineers Consultation

Below is a list of meetings CTDOT conducted with the U.S. Army Corps of Engineers (USACE) on the Walk Bridge Replacement Project in preparation for the Structures, Dredging and Fill and Section 401 permit application filing . The purposes of the meetings were to review the construction activities, discuss and resolve concerns of the USACE, and ascertain permitting requirements.

Date	Meeting
9/26/2017	USACE/USCG/CTDEEP Coordination Meeting
5/3/2018	Program Update – USCG/USACE/DEEP
1/17/2019	Interagency Coordination with CTDEEP and USACE (including follow-up coordination)
2/14/2019	USACE-USCG Meeting
7/23/2019	Structures, Dredging and Fill, and Tidal Wetlands Pre-Application Meeting
9/9/2019	Coordination meeting regarding Section 404 and Section 408 permitting.
9/2/2020	Coordination meeting regarding Section 404 and Section 408 permitting.
12/14/2020	Coordination meeting regarding Section 404 permitting.

Appendix A – Activity Specific Information:

- I. Dredging and the Disposal of Dredged Material**
- II. Shoreline Erosion or Stabilization Structures, Breakwaters
or Wave Attenuators**

Appendix A: Activity Specific Information

I. Dredging and Disposal of Dredged Material

A. Dredging

Dredging requirements include both maintenance dredging and new dredging. **Attachment I, CA17, Dredging Operations**, provides a work description and dredging plans. Additional earthwork activities in Sites 1, 2, and 3 are shown in CA 12, Submarine Cable Removal and CA 14, Pier Removal. **Drawing SUM-2** provides project summaries of dredging and excavation volumes.

Maintenance Dredging. Maintenance dredging will be required in Sites 1, 2, and 3, shown in Figure 1 and described in **Part III, Question 2a, Sections 1.8, 2.7, and 3.7**. As shown in Figure 2, an October 2016 bathymetric survey of the Norwalk River at the bridge site, maintenance dredging to meet the federal channel depth of 10 feet below mean low low water (MLLW) will be required at the locations of the existing bridge substructure, including the swing span's pivot pier and rest piers and the protective fenders. Following the removal of the pivot pier fender system, those portions of the Norwalk River that are not currently maintained as part of the 170-foot federal navigation channel (the pivot pier and immediately north and south of the pivot pier) will be dredged to match the federal channel depth and tie into the existing 125-foot navigation channel that exists upstream of the bridge. The maintenance dredging will increase the effective width of the navigation channel and improve the alignment through the proposed Walk Bridge to and from the Stroffolino Bridge.

The extent of work for maintenance dredging at the bridge is defined by the need to achieve the authorized dredge depth in the channel at the bridge location. The extent of the work area is shown in **Attachment I, CA17** (Drawings CA17-2, CA17-3, CA17-6). Over-dredging by as much as one foot below the authorized dredging elevation of -13.98 (NAVD88) to Elevation -14.98 (NAVD88) is allowable. The side slopes of the channel are required to be at a maximum of a 3:1 slope. Following the dredging operation, a post-dredging hydrographic survey will be conducted to confirm that the dredging has been completed in conformance with the allowable and permitted project footprint and depth. Prior to work start, the work area will be enclosed by a turbidity curtain. Dredging conducted between December 1st and January 31st will be performed within a turbidity curtain. If necessary to dredge from February 1st through November 30th, dredging will be conducted within a marine enclosure enclosed by a turbidity curtain.

New Dredging. New dredging will be required at Sites 4 and 5.

New dredging in Site 4 will be required in two areas of the proposed Maritime Aquarium and Sheffield Island Ferry vessel dock relocations (**Attachment I - CA3, CA17-4, CA17-7**) Dredging will be west of the navigation channel and will not impact the navigation channel.

As described in **Part III, Question 2a, Section 4.1**, the existing docks of the Sheffield Island Lighthouse Ferry and Maritime Aquarium's research vessel will be removed and replaced with a new 213-foot long dock; the footprint of the new dock will be slightly reconfigured and generally overlap the footprints of the existing docks. The two existing gangways will be removed and reused on the single dock and supplemented with an 80-foot accessible gangway constructed at the southern end of the reconfigured dock. The single, longer dock will provide the operators with flexibility to adjust vessel berthing to the northern or southern end of the dock. Dredging will be required in two areas at Site 4: at the southern end of the

Figure 1 – Location of Walk Bridge Project Sites 1 - 5 Requiring Dredging

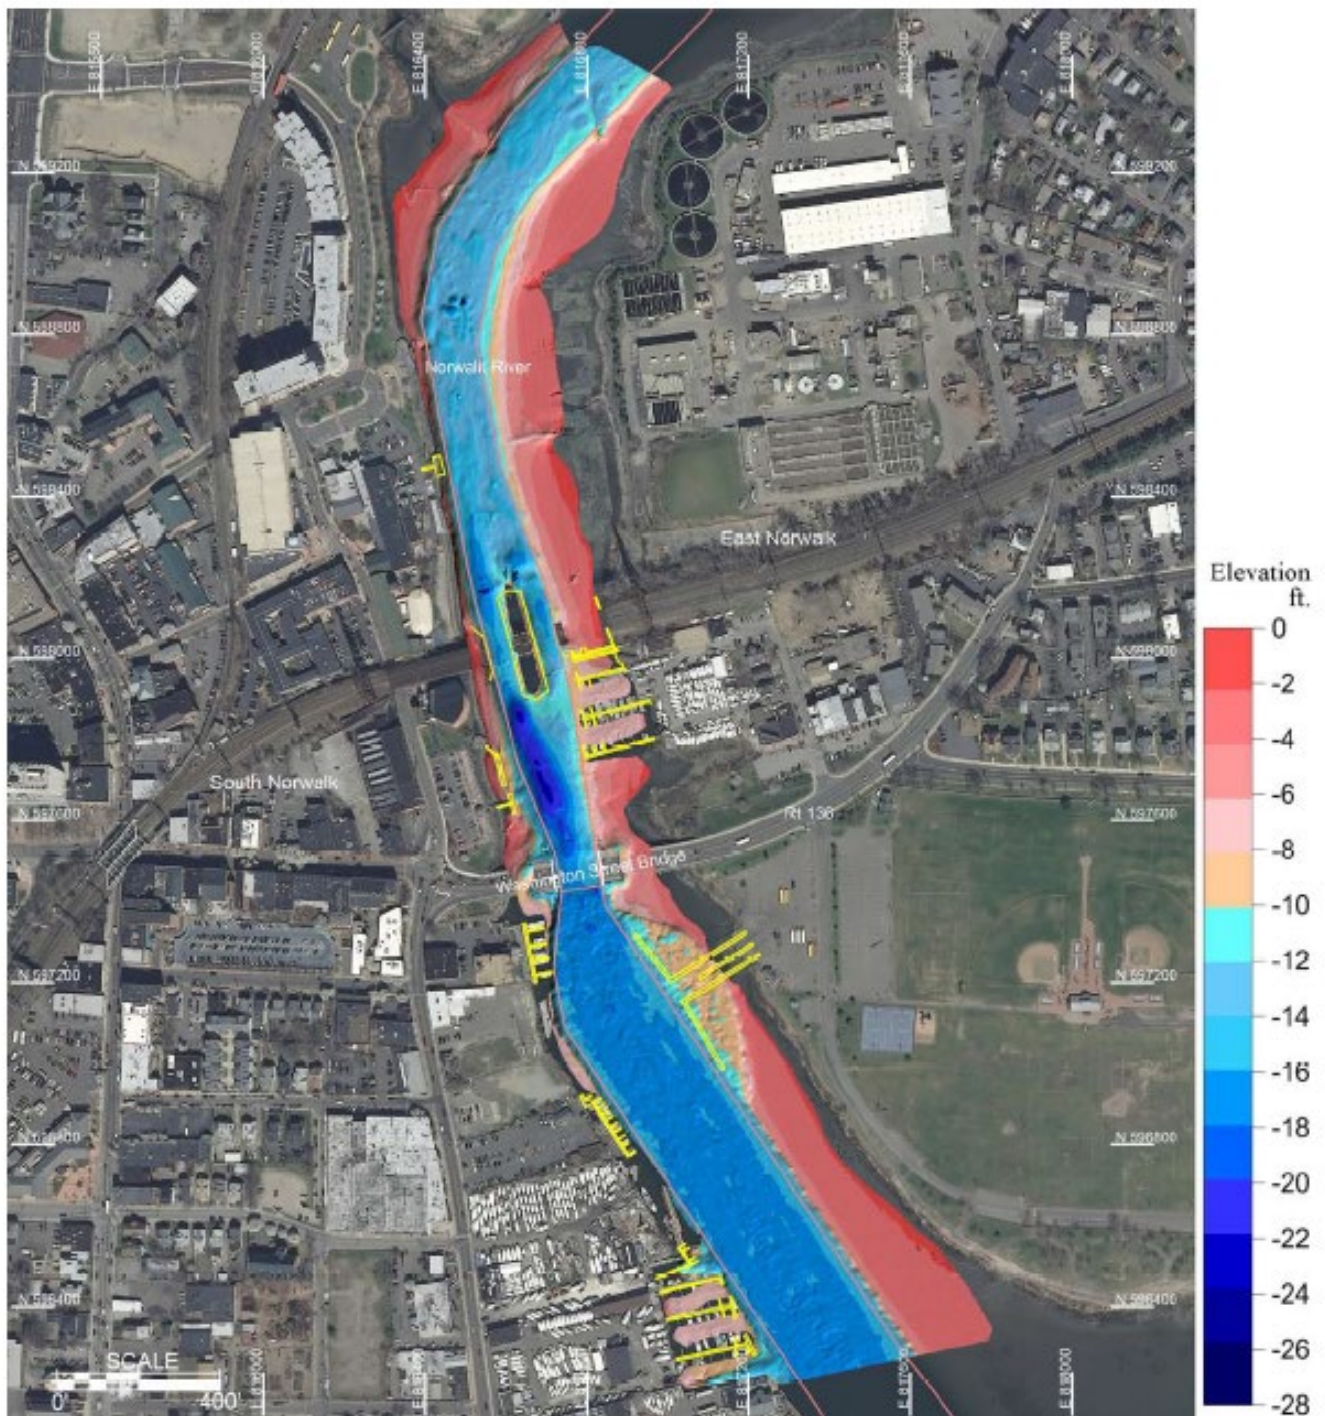

Figure 2 – Bathymetric Survey of the Norwalk River at Walk Bridge, October 19-20, 2016

new dock, to facilitate access to the reconfigured dock by the Maritime Aquarium and Sheffield Island Ferry vessels; and at the northern end of the new dock, to facilitate continuous use of the dock during low tide periods.

Dredging will be performed to an elevation approximately 4.0 feet below MLLW, or Elevation -8.0 (NAVD88), to the limits and footprints shown in CA 3 and CA17. Prior to work start, the work area will be enclosed by a turbidity curtain. Dredging conducted between December 1st and January 31st will be performed within a turbidity curtain. If necessary to dredge from February 1st through November 30th, dredging will be conducted within a marine enclosure and temporary fender enclosed by a turbidity curtain.

New dredging in Site 5 will be required to facilitate bulkhead construction and for the installation of temporary dock facilities at the Marine Staging Yard (**Attachment I - CA 4, CA17-5, CA17-7**), as described in **Part III, Question 2a, Sections 5.1 and 5.2**. Prior to work start, the work area will be enclosed by a turbidity curtain. Dredging conducted between December 1st and January 31st will be performed within a turbidity curtain. If necessary to dredge from February 1st through November 30th, dredging will be conducted within a marine enclosure and temporary fender enclosed by a turbidity curtain. Dredging will be conducted to Elevation -11.0 (NAVD88) between the bulkhead and the marine enclosure, within the limits and footprint shown in CA4 and CA17.

Dredging Restrictions and Methodology. Unless occurring within a marine enclosure, dredging will be restricted to the approved winter excavation window (December and January) and will be conducted within a turbidity curtain. Sediment will be mechanically dredged from a crane on a spudded crane barge using a clamshell bucket. Vessels, whether unloaded or loaded, will avoid contact with the bottom of the channel. The dredging equipment will be required to operate efficiently for the depths of dredging and the volume of dredged material to be generated and will not generate excessive turbidity or create excessive noise. The excavated sediment will be loaded onto material barges, modified to include side boards and containment fabric as a holding area. When the barge is fully loaded, it will be moved off-site and off-loaded with an onshore crane or excavator. Sediment spoils will be dewatered/decanted on barges or work platforms and the dewatered wastewater will be treated as necessary prior to being discharged back into the river. The excavated material will be managed per CTDEEP requirements, as further described in **Section B. Disposal of Dredged Material**. The work will be scheduled so that one existing channel will remain open to navigation. The turbidity curtains will remain in place until that portion of the project is complete and the turbidity has settled to no more than pre-construction conditions.

Initially, the eastern construction work platforms will be used for loading of dredged material from the barges. The construction yard at the bridge site (1 Goldstein Place; Parcel 3/1/25) will be used for off-loading of dredged material from the construction barges prior to transfer, management, and disposal (as described in **Section B. Disposal of Dredged Material**) in accordance with the contract specifications and permits.

Dredging Impacts – Water Velocities. The hydraulic model developed for the project indicates that the velocities through the bridge will be lower post-dredging than existing conditions. Except for the larger design storms (200-year and 500-year floods) the proposed velocities through the bridge will be less than 2 feet/second. The average decrease in velocity is 0.30 feet/second. The existing very low velocities (between 0.6 and 1.6 feet/second) are less than the critical velocity of most materials that contribute to sedimentation. Although the velocities will be lower, the removal of the center pivot pier will reduce the likelihood of vortices that may trap debris, while allowing more efficient flushing during the tide cycle.

Dredging Impacts – Aquatic Habitats. The waters in and around Walk Bridge, consisting of the Norwalk River and Norwalk Inner Harbor, serve as habitat for several benthic species, further described in **Part III**,

Question 4. Dredging will impact subtidal habitat, by removing benthic communities and increasing water depths. The changes in water depths due to the dredging are not expected to alter use of the areas by the Endangered Species Act (ESA)-listed sturgeon or sea turtle species, and the underlying substrates will allow for recolonization by algae and benthic organisms from adjacent communities, given the proximity to colonizing biota nearby in the river and harbor.¹ Recruitment rates by algae and benthic fauna are tied to light penetration into the water column, water chemistry and temperature, substrate characteristics, and other factors such as wave or tidal energy, and bathymetry. Habitat disturbance from project dredging will result in a change in depth for select portions of the river and temporary alteration of the shadow pattern; however, dredging will not change the use of the areas by ESA-listed species nor diminish water quality such that there will be effects on an individual that can be meaningfully measured, detected, or evaluated.

With respect to encountering species, dredging activities will only occupy small fractions of the width of the river in their respective locations, allowing ample room for avoidance. Dredging will be conducted using a mechanical dredge (clamshell bucket) and interactions with the ESA-listed species are extremely unlikely to occur. For an individual to be impacted by a clamshell bucket, it would likely need to be directly below the bucket as it reaches the riverbed and remain motionless as the bucket closes. Capture incidents due to dredging are discountable due to the river extents available for avoidance and passage, and the time of year that dredging will likely take place (December and January), when ESA-listed species are expected to be absent.

The dredging will cause temporary localized increases in turbidity/suspended sediment. The turbidity-producing work will take place within turbidity curtains and during the winter months (December and January), and also within marine enclosures if it is necessary to dredge from February through November, such that no impairment of movement of ESA-listed species will be expected. Further, the restrictive work window will protect winter flounder, diadromous fish passage, and shellfish resources. As a further protective measure, CTDOT will implement water quality monitoring for all in-water work during the project. Water quality monitoring will consist of monitoring for turbidity on a continuous basis in the vicinity of each turbidity producing activity. Additionally, CTDOT will monitor for specific conductivity, salinity, dissolved oxygen, pH, temperature and water level (at one location) to determine if marine life and other natural conditions may be contributing to turbidity levels. As a result of these protective measures, any effects resulting from a change in water quality due to dredging will not be measurable, or detectable when added to the baseline conditions, and are therefore deemed to be insignificant.

B. Disposal of Dredged Material

CTDOT conducted subsurface site investigations within the Norwalk River in the vicinity of the bridge site to determine whether dredging and other work within the river would require management of contaminated sediment. In June 2018, 19 borings were advanced in the Norwalk River and a total of 70 sediment samples were collected for laboratory analysis.

The sediment analytical results were compared to the numeric criteria listed in the CTDEEP Remediation Standard Regulations (RSRs), Sections 22a-133k-1 through 22a-133k-3 of the Regulations of Connecticut State Agencies, dated June 2013, and compared to the published 2015 numeric criteria for additional polluting substances not promulgated in the June 2013 RSRs. While the RSRs apply specifically to sites

¹ Rhoads, Donald C., and Joseph D. Germano. (1982) Characterization of Organism-Sediment Relations Using Sediment Profile Imaging: An Efficient Method of Remote Ecological Monitoring of the Seafloor (REMOTS super (TM) System). Marine ecology progress series. Oldendorf 8.2 (1982): 115-128.

at which remedial actions are required by CTDEEP, which is not applicable to the Walk Bridge Replacement Project, the RSR numeric criteria were used as guidelines to evaluate concentrations of regulated compounds detected in sediment regarding handling and management of material during excavation. Polluted soil is defined as containing any substance at a concentration above the analytical detection limit. Contaminated soil is defined as any substance whose concentration exceeds the numeric criteria of the RSRs.

Based on the testing results, the Norwalk River is identified as a preliminary Area of Environmental Concern (AOEC). The sediment contains Extractable Total Petroleum Hydrocarbons (ETPH), Semi-Volatile Organic Compounds (SVOCs), pesticides, and/or metals (arsenic and/or chromium) at concentrations exceeding the RSR criteria; and is therefore classified as contaminated material. Any sediment removed from the Norwalk River will therefore be handled as controlled material.

Sediment handling will be conducted per the specifications and permits. The project includes specifications for the proper management and disposal of contaminated materials, including removal, handling, transporting and disposal during construction activities and for establishment of appropriate worker health and safety protocols.

Sediment removed from the Norwalk River through dredging will not be reused on site, but will be transported to CTDOT-designated upland Waste Stockpile Areas (WSAs), where the material will be tested and managed prior to off-site disposal per the contract specifications and permits. For other excavation in the river (with the exception of the recently installed CP-243 Interlocking Project submarine cable removal, CA12), the top four feet of material excavated from the current top of river sediment will be transported to the WSAs, where the material will be tested and disposed of per the specifications. Material below the top four feet of excavation can be returned to the trench from where it came. Project-generated material at the WSAs will be managed in accordance with the General Permit for Contaminated Soil and/or Sediment Management (Staging and Transfer). Wastewater generated during dewatering activities will be managed in accordance with CTDEEP requirements.

Project-generated material at the WSAs will be managed in accordance with the CTDEEP General Permit for Contaminated Soil and/or Sediment Management (Staging and Transfer). The WSAs will be included in the Walk Bridge Program Stormwater Pollution Control Plan (SWPCP) and covered under the Program's General Permit for Discharge of Stormwater and Dewatering Wastewaters from Construction Activity (Construction General Permit). Wastewater generated during dewatering activities will be managed in accordance with CTDEEP requirements. When not actively being used, stockpiled materials at the WSAs will be covered with polyethylene plastic sheeting and secured with sandbags. Soil stockpiles will be placed on an impervious surface to prevent the transfer or infiltration of contaminants from the soil stockpile to the ground. Anti-tracking measures will be implemented at the WSAs to minimize vehicle tracking of soil from the WSAs onto the public roadways. Run-on and run-off controls will be consistent with the 2002 Connecticut Guidelines for Soil Erosion and Sediment Control. The stockpiles will be protected from wind erosion and dust transport by tarps and dust suppressants, and the area will be regularly maintained through the completion of the project. Sorbent booms will be placed along the perimeter of the WSAs if needed. The Contractor will prepare a specific operations and management plan for the project-generated material, which will include tracking procedures, emergency preparedness plans, and inspection and maintenance procedures. Following the removal of all stockpiled material, the contractor will be responsible for decontaminating the area using dry decontamination procedures. Following decontamination, the WSAs will be dismantled.

Following the determination of disposal classification of material at the WSAs, the dredged material will be loaded, transported to, and disposed of at a CTDOT-approved facility for the disposal/recycling/treatment of non-hazardous sediments. CTDOT has identified a list of allowable disposal facilities for Connecticut regulated wastes from which the contractor may use; no other facility can be used without approval. The list of allowable disposal facilities is included in the contract specifications.

II. Shoreline Erosion or Stabilization Structures

The Walk Bridge Replacement Project will include construction of three shoreline erosion or stabilization structures: a permanent bulkhead at the Marine Staging Yard, 68 and 90 Water Street; and a living shoreline at two wetland mitigation areas.

Permanent Bulkhead at the Marine Staging Yard

CA4 includes the construction of a permanent sheet pile bulkhead waterward of 68 and 90 Water Street (Parcels 2/84/19 and 2/84/33). The sheet pile bulkhead has been designed to limit the amount of dredging in front (waterward) of the wall and the need for any material removal on the landside of the wall.

For the use of the Marine Staging Yard as a construction staging and storage yard, CTDOT is obtaining a construction easement for a portion of 68 Water Street and is acquiring 90 Water Street (and 70 Water Street, Parcel 2/84/63). Additionally, CTDOT is obtaining a temporary easement along the entire waterfront of 68 Water Street, extending beyond that required for the Marine Staging Yard, to construct the bulkhead. This temporary easement will cease following bulkhead construction. Following the completion of the project, the construction easement at 68 Water Street will be released and 70 and 90 Water Street will be sold (as described in **Part III, Question 5.2**).

A. Alternatives Analysis

As described in **Part III, Question 2a, Section 5.1**, the new bulkhead is included in the project to provide construction flexibility. CTDOT is anticipating that construction of the bulkhead will not be required.

CTDOT conducted an alternatives analysis for the permanent bulkhead to be constructed at the Marine Staging Yard. Three options were considered:

- Option 1: No Build. Option 1 would leave the existing deteriorated bulkhead in place and would not construct a replacement bulkhead. This option would not provide CTDOT with project construction flexibility.
- Option 2: Nonstructural Shoreline Stabilization. Option 2 would remove the existing deteriorated bulkhead and regrade the shoreline to a stable slope. The shoreline would utilize nonstructural stabilization measures such as a living shoreline or other bioengineered solution. Regrading of the site would reduce the functionality of the location as a water-dependent use and could potentially adversely impact adjacent parcels by: creating slope stability issues along the property lines, since the adjacent properties would be higher than a regraded Marine Staging Yard; and affecting site drainage patterns, including localized erosion around adjacent bulkheads. Option 2 would not provide CTDOT with project construction flexibility.
- Option 3: Replace Bulkhead. Option 3 would replace the existing deteriorated bulkhead with a new permanent sheet pile structure. The new structure would maintain the hydraulic characteristics

of the river and avoid impacts to adjacent properties. Option 3 would provide CTDOT with project construction flexibility.

B. Level of Protection

The bulkhead at the Marine Staging Yard will be designed to remain stable during the 200-year scour design event as outlined by CTDOT requirements.

C. Erosion and Sediment Control

The bulkhead is in a VE flood zone subject to significant wave action; however, due to the low velocities in this section of the Norwalk River (1 to 1.2 feet/second), a conservative rate of two feet of scour is estimated. The bulkhead will not result in any adverse erosion or sedimentation of adjacent properties, lands, wetlands, or waters, nor will it result in any increased transport of sediment.

D. Toe and Flank Protection

The steel sheet piles comprising the bulkhead will be driven to a depth to ensure adequate embedment into the subgrade to develop the full pile structural capacity of the system. Due to the limited scour potential, no protection, or armoring, of the sheet pile wall's toe is anticipated. The structural system of the sheet pile bulkhead will allow for a cantilevered wall system without anchors.

E. Drainage Measures

Upland stormwater will follow existing drainage patterns. Runoff will be diverted away from the bulkhead and travel overland toward Water Street where it will be collected by the existing stormwater drainage systems that ultimately discharge into the Norwalk River.

F. Impacts on Adjoining Properties

The bulkhead will be located waterfront of 68 and 90 Water Street, following the natural shoreline, and will terminate approximately 10 feet inside each property line on the northern and southern limits of the bulkhead. The development of the bulkhead will not impact the adjoining parcel to the north (50 Water Street) or to the south (100 Water Street).

G. Impacts on Sediment and Water Quality

Construction of the bulkhead will not result in adverse impacts to sediment or water quality/habitats. Construction of the bulkhead will be completed inside a marine enclosure and turbidity curtain around its outside perimeter, which will be installed prior to work start. As a further protective measure, CTDOT will implement water quality monitoring for all in-water work during the project.

Underwater noise associated with the bulkhead's pile driving activities will exceed behavioral and physiological thresholds. Impacts associated with underwater noise will be mitigated for by starting each shift with a soft start for all pile driving activities that are conducted outside the November 1st through March 15th timeframe, per U.S. Army Corps of Engineers (USACE) guidance, as described in **Part III, Question 1**.

Living Shoreline at Wetland Mitigation Areas

Wetland mitigation proposed for the Walk Bridge Replacement Project will include restoration of degraded tidal salt marsh wetlands. At Wetland Mitigation Areas 2 and 6, the proposed mitigation includes

developing “Living Shorelines,” the components of which are a rock riprap sill/berm with establishment of salt marsh vegetation on the landward side of the sill. Oyster cultch will be placed among the exposed rocks on the waterward side of the riprap sill, in accordance with CTDOT’s specifications. As such, the rock riprap component is a shoreline erosion control “structure.” The purpose and benefits of Living Shoreline development for this project include the following:

- Restoring and enhancing habitat to support fish and other aquatic species;
- Maintaining aquatic/terrestrial interface and connectivity;
- Providing shoreline access for wildlife;
- Improving water quality by settling or trapping sediment and filtering pollution;
- Implementing erosion control and shoreline stabilization by absorbing wave energy so that reflected waves do not scour the shallow sub-tidal zone;
- Enhancing community enjoyment; and
- Providing opportunities for community education.

A desktop analysis and numerous site reviews were conducted to assess various applicable factors involved in the development of the Living Shoreline, with a rock sill/berm structure, for restoration of the tidal marsh wetlands as follows:

Erosion History. Within the wetland mitigation areas, the current erosion rate of the actual tidal substrate appears to be low or very low, although adjacent shoreline erosion has been historically heavy in this area. This was evidenced by observation of steep, collapsing banks within a majority of the study area. Efforts to control shoreline erosion with the use of heavy armoring and gabions appear to be working where implemented, but the loss of bank material has raised elevations in abutting marsh. This has likely contributed to degradation of the systems and promoted colonization by *Phragmites*.

Wind Wave Energy. The wave energy at each mitigation area was determined by measuring the distances to the far shore (fetch) and calculating the “average fetch” and the “longest fetch”:

- Mitigation Area 2 – Average Fetch = 0.2 mile; Longest Fetch = 0.6 mile
- Mitigation Area 6 – Average Fetch = 0.1 mile; Longest Fetch = 0.3 mile

Wave energy levels, based on fetch, are categorized in the document *Living Shorelines Engineering Guidelines*.² Based on the resulting distances for the areas, the wave energy regarding average fetch is in the “Very Low” category for both mitigation areas. The wave energy for the longest fetch distances is in the “Low” category for Area 2 and in the “Very Low” category for Area 6. According to the *Guidelines*, developing Living Shorelines by using “Sill/Marsh” techniques is suitable for areas in the Low and Very Low wave energy categories. The *Guidelines* also recommend that rock size for berm/sill structures in the low and very low wave energy environments should be 17-inches to 24-inches in diameter, with a weight ranging from 300 to 900 pounds.

² Miller, J. K., Rella, A., Williams, A., & Sproule, E. (2016). *Living Shorelines Engineering Guidelines*. Report prepared for the New Jersey Department of Environmental Protection. Stevens Institute of Technology. Report No. SIT-DL-14-9-2942. Revised February 2016.

Storm Surge. For Living Shorelines, the storm surge is mostly insignificant. The rock riprap sill structures are not intended to provide protection from storm events, as they are low-lying and will be overtopped during storms.

A. Alternatives Analysis

CTDOT considered two non-structural alternatives to a Living Shoreline, consisting of tidal marsh planting and coir logs with tidal marsh planting, as follows:

- Tidal Marsh Planting Alternative. Wetland Mitigation Area 2 would require *Phragmites* removal, regrading, topsoil placement, and marsh planting. Wetland Mitigation Area 6 would require removals of existing rock riprap, topsoil placement, regrading, and marsh planting.

Although this alternative is feasible and would provide most of the previously listed benefits of Living Shorelines, it would not provide the same level of wave absorption, sediment trapping, and wetland edge erosion protection as a rock riprap sill/berm at the edge of the marsh planting.

- Coir Logs with Tidal Marsh Planting Alternative. Wetland Mitigation Areas 2 and 6 would require the same measures used in the Tidal Marsh Planting Alternative, with the addition of coir logs at the waterward edge of the marsh planted area. The coir logs are considered temporary protection and are biodegradable. They will gradually decay within three to five years of their initial placement in a tidal environment. While the coir logs are undergoing decay, the adjacent planted vegetation becomes an established marsh and provides some shoreline protection over time.

Although this alternative is feasible and would provide most of the previously listed benefits of Living Shorelines, coir logs are considered temporary components regarding absorbing wave energy because they decay over a period of three to five years. The adjacent planted vegetation becomes an established marsh and provides a moderate level of shoreline protection over time, in the low and very low wave energy environment. However, this alternative would not provide the same level of wave absorption, sediment trapping, and wetland edge erosion protection over time as a rock riprap sill/berm at the edge of the marsh planting.

The two alternatives to the Living Shoreline would have less environmental impact than the proposed structural alternative of placing a rock riprap sill/berm on the mud substrate of the Norwalk River, as proposed for Mitigation Areas 2 and 6. However, the marsh edge may still be subject to somewhat more potential erosion with those alternatives than the potential erosion that could occur with the rock riprap structure. In addition, the long-term level of wave absorption and sediment trapping benefits provided by the proposed rock riprap structure would not be realized with either of the two alternatives.

Based on the alternatives analysis, CTDOT determined that development of a Living Shoreline, comprised of rock riprap sill/berm with establishment of salt marsh vegetation on the landward side of the sill/berm, is the preferred alternative for Wetland Mitigation Areas 2 and 6 in restoring the existing degraded and low-functioning tidal salt marsh wetlands.

The Living Shoreline at the two mitigation areas will not impair access to or along the public lands and waters waterward of mean high water (MHW), Elevation 3.35 (NAVD88). The proposed rock structures will vary in height from approximately 18 inches to three feet. The proposed top elevation of the rock

structures will be approximately 0.0' at Mitigation Area 2 (an approximate 18-inch to 24-inch height at or slightly above the proposed final grade of the low marsh area), and 1-foot at Mitigation Area 6 (an approximate 2-foot to 3-foot height at or slightly above the proposed final grade of the low marsh area). Therefore, the proposed structures will be lower than the MHW elevation, and there will be no unreasonable impairment of access to or along the public lands and waters waterward of MHW. In addition, openings in the structures will allow for aquatic wildlife access to and from the marsh area.

B. Level of Protection

The proposed rock riprap sill/berm structures are not intended to provide protection from storm events, as they are low-lying and will be overtopped during storms. Being in low/very low wave energy environments, and consisting of rock riprap, they are anticipated to remain in place for the life of the rock material.

C. Erosion and Sediment Control

The erosion level of the existing shoreline at adjacent properties is currently low or very low. A review of historical aerial photographs indicated minimal shoreline erosion, if any, based on shoreline conditions in 2006 aerials compared to conditions visible in subsequent years (up to 2019, a 13-year span). The proposed rock riprap structure will continue to minimize erosion and will likely reduce current erosion rates.

The areas seaward of the proposed rock structure consist of open water at high tide and intertidal mudflats at low tide. The existing erosion or sedimentation processes along these environments will continue at the same rate. The rock structures are low-lying and extend only along the two mitigation areas. Therefore, they are not likely to adversely affect those processes on the seaward side.

As the tide fluctuates in the mitigation areas, the proposed rock structure will function to trap sediment in the marsh area on the landward side of the structure. However, transport of sediment will continue to occur along the shoreline areas outside of the mitigation areas.

D. Toe and Flank Protection

Due to the low and very low wave energy ratings at the two mitigation areas, toe protection of the proposed rock riprap structure is not necessary. However, the rock structure at Mitigation Area 2 will utilize 24-inch to 30-inch diameter rock, with the larger 30-inch rock placed at the toe of the structure and anchored by pressing the rock into the mud substrate 6 inches to 12 inches in depth, or by placing the rock in a trench 6 inches to 12 inches deep. The base of the structure will be a minimum width of 3 feet and the height will be approximately 18-inches to 24-inches. At Mitigation Area 6, existing rock riprap at the site will be excavated and reused to construct the rock sill/berm with a 1:1 side slope on the landward side and 1.5:1 side slope on the waterward side. The base of the structure will vary from 7 feet to 9.5 feet, with the height varying from 2 feet to 3 feet. The rock used for the structure will be an average size of 18-inches in diameter, although some rock could be as small as 12-inches or as large as 24-inches in diameter. The reused rock will be placed on the existing rock riprap substrate base, which is already anchored in the substrate and will function as toe protection.

Note that the *Guidelines* recommends that rock size for sill/berm structures in the low and very low wave energy environments should be 17-inches to 24-inches in diameter, with a weight ranging from 300 to 900 pounds.

E. Impacts on Adjoining Properties

The potential for adverse impacts from the proposed rock structure to adjoining properties and structures is very low. The low-profile rock structures and restored tidal wetlands will enhance the protection of the shoreline of adjacent properties.

F. Impacts on Sediment and Water Quality

The Norwalk River currently receives contaminants via stormwater runoff from streets, roofs, parking lots, and other typical urban sources, as well as the railroad right-of-way, without treatment before it enters the river. Water impairments in this stretch of the Norwalk River are due to pathogens (*Enterococcus Bacteria* and *Fecal Coliform*) and nutrients (Total Nitrogen and Nutrient/Eutrophication biological indicators). In addition, CTDEEP's water testing of the Norwalk River indicates that bacteria (*Escherichia coli*) exceeds the CTDEEP criterion for a Class B river, and every sampling station exceeds CTDEEP's single sampling maximum. Nutrient concentrations for both nitrogen and phosphorus exceed CTDEEP's water quality standards.

During construction of the Living Shoreline, temporary impacts to sediment quality and water quality may occur as a result of turbidity and suspended solids. To minimize water quality impacts, turbidity curtains will be installed around the perimeters of the mitigation areas prior to the start of construction. The turbidity curtains will extend from the surface to the bottom of the river to minimize potential sediment release to the river. In addition, excavation and grading will be performed at low tide. The turbidity curtains will remain in place until the river bottom has been stabilized.

The river substrate has been determined to be contaminated; therefore, excavated material will be transported off-site, managed at a CTDOT-designated WSA, and disposed of off-site (as described in B. Disposal of Dredged Material).

Best Management Practices (BMPs) will be incorporated during construction to minimize impacts to water quality and sediment quality. For discharges into waters of the U.S., a Section 401 Water Quality Certification will be required from CTDEEP and a Section 404 General Permit will be required from the USACE. These permits will stipulate that this work is consistent with the federal Clean Water Act and Connecticut Water Quality Standards. A National Pollutant Discharge Elimination System (NPDES) permit will also be required as administered by the State of Connecticut via a General Permit for the Discharge of Stormwater and Dewatering Wastewaters from Construction Activities.

Water quality will be improved following development of the Living Shoreline. After the proposed rock structure is complete, one of its functions will be to trap sediment in the marsh area on the landward side of the structure. The settling and trapping of sediments and filtering of pollutants in the marsh areas will improve water quality in this portion of the Norwalk River.
